2. INTRODUCTION

The three-phase smart energy meters of the R203 and R204 series allow the measurement and calculation of electrical quantities such as voltage, current, power, energy, harmonics, etc.

The devices are equipped with a universal current input (TA with current output, TA with voltage output, Rogowski sensors) and support single-phase and three-phase 3- or 4-wire insertion types.

Measurements and calculations are made available via communication protocols depending on the model.

In some models It is also possible to activate the data logger and send the data to the clouds via the MQTT(s), HTTP(s) or FTP protocols.

3. R203 AND R204 SERIES MODELS

The R203 and R204 series models are shown in the table:

4. *FLEX TECHNOLOGY FOR PROTOCOL CHANGE*

The R203 and R204 series devices include Flex technology.

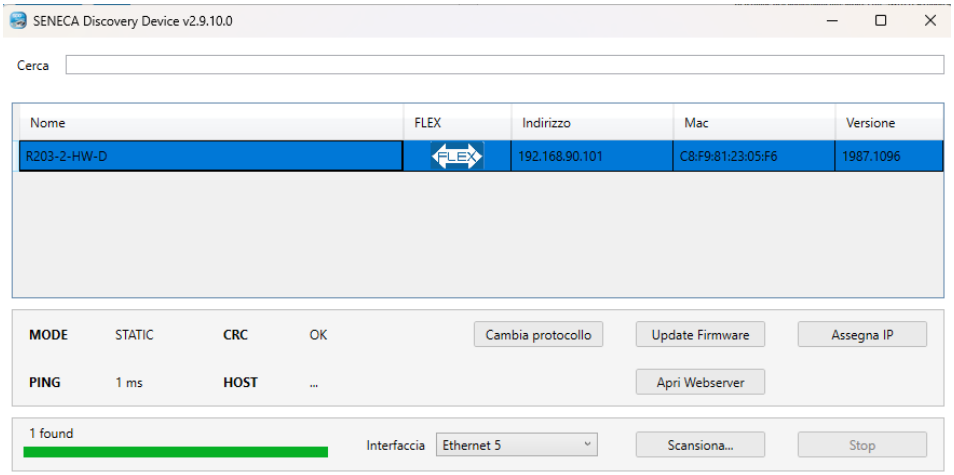
Flex allows you to change the combination of industrial communication protocols supported at will from a list of available ones, the development is continuously updated, for a complete list refer to the page: https://www.seneca.it/flex/

Some examples of supported protocols are:

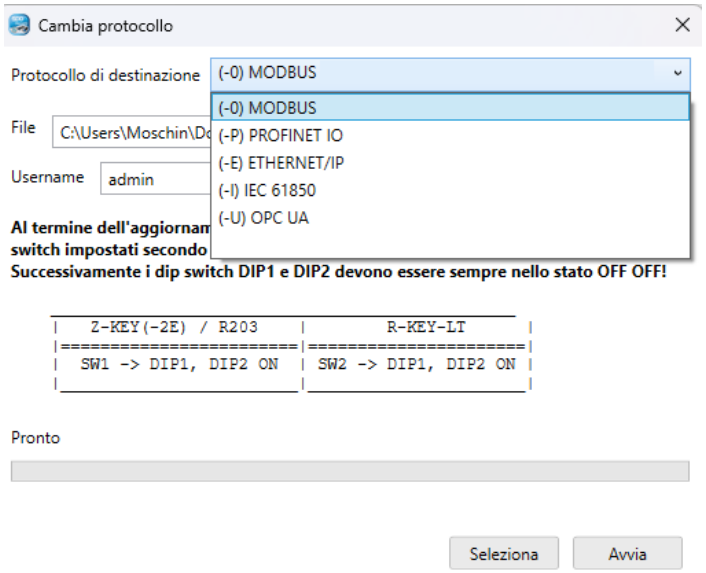
The power meter then becomes “universal” and compatible with Siemens or Rockwell or Schneider systems etc... without the need to purchase different hardware.

4.1. CHANGING PROTOCOL WITH SENECA DISCOVERY DEVICE SOFTWARE

From revision 2.8 the Seneca Discovery Device software identifies the devices that support the “Flex” technology:



It is possible to press the “Change Protocol” button and select the destination protocol from those in the list:



At the end of the operation, bring (only at the first power-on) the dip switches 1 and 2 to “ON” to force the device to default (see also the chapter “RESETTING THE DEVICE TO ITS FACTORY CONFIGURATION”).

5. *DIP SWITCH*

The devices are fitted with 2 dip switches.
The position of the dip switches is shown in the figure.

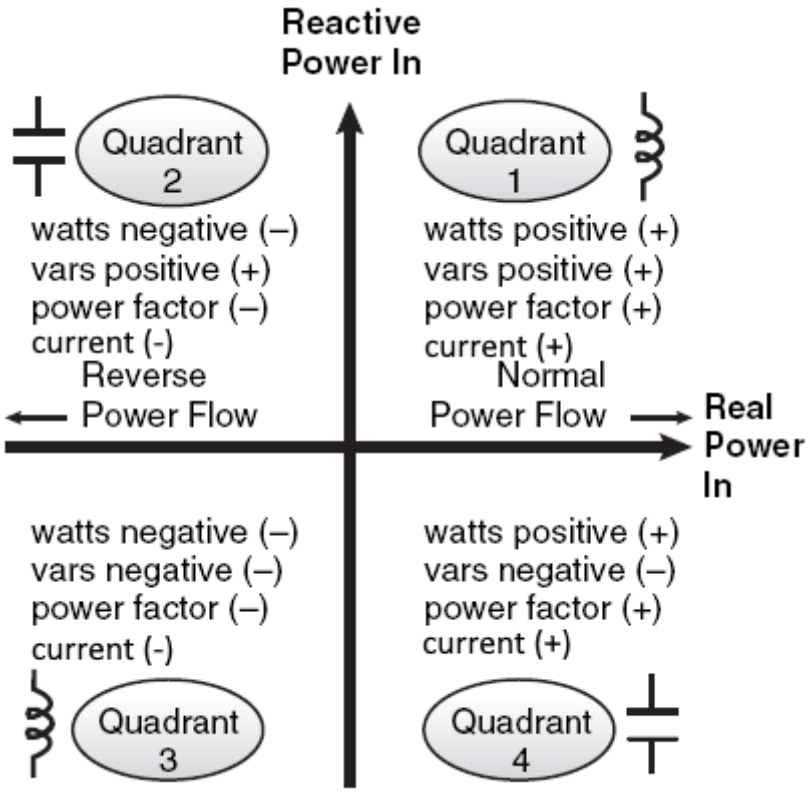
Below is the meaning of the SW1 dip switches:

DIP1	*DIP2*	*MEANING*
OFF	OFF	Normal operation: The device loads the configuration from the flash.
ON	ON	Resets the device to its factory configuration
OFF	ON	Disables access to the Web server
ON	OFF	Forces the device IP address to 192.168.90.101

6. MEASUREMENTS AVAILABLE FROM ETHERNET/SERIAL

6.1. CONVENTIONS

The device provides the measurement values on all 4 quadrants, the conventions for the signs of the measurements used in the product are summarized in the following image:



Where:
quadrant Q1 relates to an inductive load with imported (absorbed) active energy, classic use case.
quadrant Q2 relates to a capacitive load with exported (generated) active energy.
quadrant Q3 relates to an inductive load with exported (generated) active energy.
quadrant Q4 relates to a capacitive load with imported (absorbed) active energy.

10. DATALOGGER (MODBUS PROTOCOL MODELS ONLY)

The device has two different data loggers (that can be enabled also simultaneously):
- a configurable sampling time data logger with a maximum speed of 1 sample per second;
- an event data logger, that is, it records the configured event (just one) and the date/time when it occurred;

It is possible to download the data of both data loggers to a device via web server, the format is text separated by commas (csv standard).

10.1. TIME DATA LOGGER

The time data logger allows you to store a maximum of 30 variables (tags) in the device's internal flash for a maximum number of 65472 samples each with a maximum of 30 variables.
The sampling time can vary between 1 second (minimum) to 24 h (maximum).
It is also possible to start e stop the data logger through the status of a digital input.

Example of the contents of the time data logger csv file:

```

10.2. EVENT DATA LOGGER

If you need to record the date/time of a particular event, you can use the event data logger.
This can record a maximum of 512 samples of a single event with their time tags.
It is possible to define just one event by indicating the variable to be monitored and its threshold (or alarm window).

Example of the contents of the event data logger csv file:

```
DATE/TIME;EVENT TYPE;
2023-12-07-15-24-42;ALARM;
2023-12-07-15-24-45;ALARM RETURN;

2023-12-07-15-24-49;ALARM RETURN;
```

11. SMART FUNCTIONS FOR SENDING DATA AND EVENTS TO THE CLOUDS (MODBUS PROTOCOL MODELS ONLY)

The values acquired by dataloggers can be sent directly to the clouds by choosing between the MQTT(s), Http(s) or FTP protocols.
You can choose to send with a single protocol between Mqtt(s), http(s) or FTP.

MQTT

The MQTT protocol supported is version 3.1.1

API {REST}

The HTTP protocol for tags publication on cloud is based on API Rest

TLS 1.2

The TLS protocol supported is version 1.2

X.509

Keys certifications according to X.509 standard

11.1. MQTT(s) CLIENT PROTOCOL

MQTT is the most widely used protocol for IOT applications.

"MQTT" stands for MQ Telemetry Transport. It is an extremely simple and lightweight public/subscription messaging protocol designed for devices with low bandwidth, high latency or unreliable networks. The design principles are to minimize network bandwidth and device resource requirements while trying to ensure reliability and a certain degree of delivery guarantee. These principles prove ideal for the emerging "machine-to-machine" (M2M) or "Internet of Things" world.

For more information on the MQTT protocol see

The MQTT version supported is 3.1.1
Sending via MQTT can be parameterized using a simple syntax, it is also possible to add the timestamp (in date/time minutes seconds or in seconds since 1/1/1970 "epoch" format).
Using Mqtt it is also possible to insert a threshold beyond which data can be sent or not.

11.2. HTTP(s) POST PROTOCOL

Communication with the Clouds is possible via HTTP protocol with a POST call.
The data sent to the server is contained in the body of the HTTP request.
Sending via HTTP can be parameterized using a simple syntax, it is also possible to add the timestamp (in date/time minutes seconds or in seconds since 1/1/1970 "epoch" format).

11.3. FTP CLIENT PROTOCOL

Data can also be sent to an FTP server.
In this case the logs are sent directly in the csv format produced by the data logger

11.4. SENDING DATA AND EVENTS WITH OR WITHOUT RECOVERY

If you set a log sampling time over or equal to 30 seconds, you can activate the recovery function.
In this mode data are sent with the configured sending time but, in the event of a communication hole, anything that has not been sent will be sent at the next connection.

11.5. *SENDING COMMANDS TO THE DEVICE VIA MQTT(s) PROTOCOL*

The device is compatible with receiving commands via the MQTT(s) protocol.
By default, the subscription topic for commands is configured as follows:
`seneca/%c/cmd`
Where %c represents the client ID or a unique device identifier, dynamically replaced upon connection.

This configuration can be modified via the web interface in the section:
System Connection → MQTT

The MQTT commands supported by the device are as follows:

12. CONNECTION OF THE DEVICES TO A NETWORK

12.1. MODBUS, ETHERNET/IP AND OPC-UA PROTOCOLS MODELS

The factory configuration of the IP address is:

Static address: 192.168.90.101

Therefore, multiple devices must not be inserted on the same network with the same static IP.
If you want to connect multiple devices on the same network, you need to change the IP address configuration (for instance using the Seneca Discovery Device software).

⚠ ATTENTION!

DO NOT CONNECT 2 OR MORE FACTORY-CONFIGURED DEVICES ON THE SAME NETWORK, OR THE ETHERNET INTERFACE WILL NOT WORK
(CONFLICT OF IP ADDRESSES 192.168.90.101)

If the addressing mode with DHCP is activated and an IP address is not received within 1 minute, the device will set an IP address with a fixed error:

169.254.x.y

Where x.y are the last two values of the MAC ADDRESS.
This way it is possible to install more I/O of the R series and then configure the IP Address even on networks without a DHCP server.

12.2. *PROFINET IO PROTOCOL MODELS*

Profinet IO devices are supplied without an IP address.

ATTENTION!

PROFINET IO PROTOCOL DEVICES ARE SUPPLIED WITHOUT AN IP ADDRESS (0.0.0.0).

MORE DEVICES CAN THEREFORE BE INSERTED INTO THE SAME PROFINET NETWORK AND IDENTIFIED THROUGH SCAN OF THE PROFINET NETWORK ITSELF

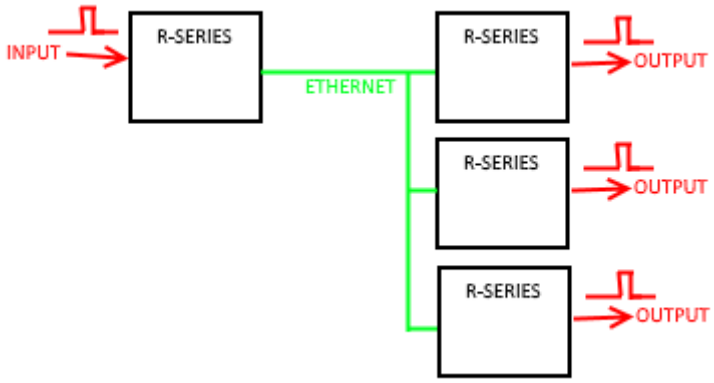
TO SET AN IP ADDRESS (FOR EXAMPLE TO ACCESS THE WEBSERVER) USE THE PROFINET CONFIGURATION ENVIRONMENT OR FORCE THE ADDRESS 192.168.90.101 WITH THE APPROPRIATE DIP SWITCH

13. I/O COPY USING THE PEER TO PEER FUNCTION WITHOUT WIRING (MODBUS PROTOCOL MODELS ONLY)

The "R" series devices can be used to copy and update in real time an input channel on a remote output channel without the aid of a master controller.

For example, a digital input can be copied to a remote digital output device:

Note that no controller is required because the communication is managed directly by the R series devices.
It is possible to make a more sophisticated connection, for example it is possible to copy the inputs to different R-series remote devices (from Device 1 Input 1 to Device 2 Output1, Device 1 Input 2 to Device 3 Output 1 etc ...)
It is also possible to copy an input to an output of multiple remote devices:



Each R-series device can send and receive a maximum of 32 inputs.

14. WEB SERVER

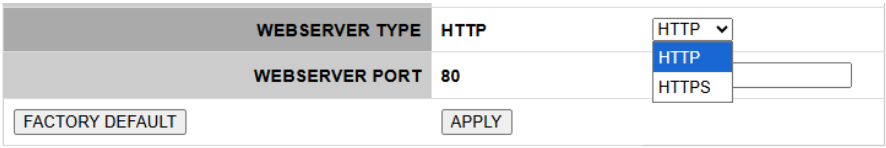
14.1. ACCESS TO THE WEB SERVER

The web server can be accessed using a web browser by directly typing the device's IP address. By default, the device is configured to use the HTTP protocol. HTTPS is not enabled by default.
To find the IP address, use the "search" function in the "Seneca Discovery Device" software.
Using the factory configuration (be careful about the model you purchased; for example, for -P models, you need to force the IP using a dip switch), you have:

http://192.168.90.101

The first time you log in, you will be prompted for your username and password.
The default values are:
User Name: admin
Password: admin

In the web server, in the "System Settings" section, there is an option that allows you to enable or disable the HTTPS connection with TLS protocol.



After enabling HTTPS, the device will only be accessible via an encrypted connection. Access must therefore be made using, for example, the following URL:

https://192.168.90.101

ATTENTION!

AFTER THE FIRST ACCESS CHANGE USER NAME AND PASSWORD IN ORDER TO PREVENT ACCESS TO THE DEVICE TO UNAUTHORIZED PEOPLE.

ATTENTION!

IF THE PARAMETERS TO ACCESS THE WEB SERVER HAVE BEEN LOST, IT IS NECESSARY TO RESET THE CONFIGURATION TO DEFAULT USING THE DIP-SWITCHES

ATTENTION!

IN R203-P AND R204-P DEVICES, BEFORE ACCESSING THE WEB SERBER, DISCONNECT THE DEVICE FROM THE IO PROFINET NETWORK

15. *CONNECTION DIAGNOSTICS*

The device includes advanced connection diagnostics available on the webserver and on communication protocols.
If the system detects a connection error, the WIRING ERROR LED will flash, at this point it is possible to check the reason for the error:

VOLTAGE CYCLIC DIRECTION If it is "Wrong" it indicates that the connection of the voltmeters does not comply with the cyclic direction R (L1) -> S (L2) -> T (L3). To solve the problem, wire the voltage inputs again.
If it is "Correct" go to the next item. This is not a real connection error (and therefore does not cause the WIRING ERROR LED to flash).

ATTENTION!

IGNORE THE VOLTAGE CYCLIC DIRECTION ERROR INDICATION IN CASE OF CONNECTION WITH ARON INSERTION

CURRENT L1..L3 If it is "STRAIGHT" it indicates that the TA relating to the i-th input is connected correctly. If it is "INVERTED" it indicates that the TA relating to the i-th input is reversed (reverse the wiring of the TA terminals). When the three currents are “STRAIGHT” it is possible to move on to the next item.

ATTENTION!

IF THE DEVICE IS CONNECTED TO A GENERATOR, IT IS CORRECT THAT CURRENT L1..L3 ARE ALL "INVERTED".
IN THIS CASE, THE WORD "PRODUCTION” WILL APPEAR IN THE "ENERGY" FIELD .

L1..L3 CONNECTION If this parameter is "CORRECT" it means that the L-i th current input and the L-i th voltage input have been wired correctly.
In the case of "ERROR" it means that, for example the Li-th phase of the current does not coincide with the Li-th voltage phase, therefore a wiring error of the ammeters or voltmeters (for example the current L1 has been connected to the current input L2).
It is, in fact, possible to wire complying with the cyclic direction of the voltages and the correct direction of the TAs but have no correspondence between the voltage and current phases.

In this case, wire the device again (for example, it is possible to move the voltmeters by 1 position, always complying with the cyclic direction until this error disappears).

In the case of non-standard installation configurations, a parameter can be configured to ignore the diagnostics.

16. DEVICE CONFIGURATION VIA WEBSERVER (MODBUS PROTOCOL MODELS ONLY)

To configure the device, access the web server and select the section you are interested in.
After a modification to the configuration has been made, the changes must be confirmed with the "***APPLY***" button entering the administrator account and password.
The ***Reboot*** button reboots the device (not necessary in the event of a configuration change).
The ***Default*** button returns all the page parameters to the default settings.

Selects whether the time should be synchronized with NTP servers

DATE/TIME SYNC MODE
Selects how often to synchronize the date/time

NTP SERVER IP ADDRESS 1
Sets the first NTP server

NTP SERVER IP ADDRESS 2
Sets the second NTP server (backup)

TIME ZONE
Sets the Timezone

DAYLIGHT SAVING TIME
Sets whether or not to activate the switchover to winter/summer time

16.7. *SYSTEM CONNECTION SECTION -> MODBUS*

SERVER PORT (ETH) (default: 502)
Sets the communication port for the Modbus TCP-IP server.

SERVER STATION ADDRESS (ETH) (default: 1)
Active only if Modbus Passthrough is also active, it sets the station address of the modbus TCP-IP server.

⚠ ATTENTION!

THE MODBUS SERVER WILL ANSWER ANY STATION ADDRESS ONLY IF THE MODBUS PASSTHROUGH MODE IS DISABLED.

MODBUS PASSTHROUGH (ETH) (default: disabled)
Sets the conversion mode from Modbus TCP-IP to Modbus RTU serial (see chapter 14).

MODBUS TCP-IP CONNECTION TIMEOUT [sec] (ETH) (default: 60)
Sets the TCP-IP connection timeout for the Modbus TCP-IP server and Passthrough modes.

BAUDRATE MODBUS RTU (SER) (default: 38400 baud)
Sets the baud rate for the RS485 communication port.

DATA MODBUS RTU (SER) (default: 8 bit)
Sets the number of bits for the RS485 communication port.

PARITY MODBUS RTU (SER) (default: None)
Sets the parity for the RS485 communication port.

STOP BIT MODBUS RTU (SER) (default: 1 bit)
Sets the number of stop bits for the RS485 communication port.

MODBUS PASSTHROUGH SERIAL TIMEOUT (default: 100ms)
Active only if passthrough mode is activated, sets the maximum waiting time before sending a new packet from TCP-IP to the serial port. It must be set according to the longest response time of all the devices present on the RS485 serial port.

16.8. SYSTEM CONNECTION SECTION -> FTP

In this section the timed sending of logs to an FTP server can be configured. The sending of the logs takes place without encryption.
By pressing the "***FTP SEND NOW"*** button a log file is forced to be sent, it will be possible to test the operation of the data entered.

DATALOGGER SENDING
Here you can select the frequency of the log sending, in the case of weekly sending you can also choose which days and at what time to send.

FTP SERVER
Sets the IP address or FTP server name.

SERVER PORT
Sets the server FTP port

USER NAME
Sets the user name to access the server FTP

PASSWORD
Sets the password to access the server FTP

FOLDER
Sets the folder to write logs to (leave blank for root)

DEVICE NAME
Sets the name you want to give to the device, this will be the initial part of the file name on the server.

ATTENTION!

IN THE EVENT OF LACK OF CONNECTION WITH THE FTP SERVER, THE DEVICE WILL CONTINUE TO RECORD THE LOGS AS LONG AS THERE IS SPACE IN THE MEMORY. WHEN THE CONNECTION RESUMES, IT WILL SEND THE LOGS NOT YET SENT IN A SINGLE FILE.

ATTENTION!

THE FORMAT OF THE FILES SENT IS THE SAME AS THAT OBTAINED BY DOWNLOADING THE TIME DATABASE FROM THE WEB SERVER (CSV FORMAT).

16.9. SYSTEM CONNECTION SECTION -> MQTT

CUSTOM CLOUD
If the MQTT cloud protocol is selected, you can choose between the clouds:

None, Direl, ONBOARD or Seneca CloudBox2

None: Through the device's MQTT configurability, it is possible to connect to virtually any cloud

Direl ADM: Sets up the device to connect to the Direl ADM cloud
On-Board: Sets up the device to connect to the On-Board cloud
Seneca Cloudbox 2: Sets up the device to connect to the Seneca Cloudbox2 cloud

To add other clouds to the list, you can make a request to Seneca.

MAX FAILURE COUNTER
It is the maximum number of attempts without a pause before declaring a transmission fail.

WAIT AFTER FAILURE (minutes)
It is the pause in minutes before trying to connect again

CLIENT ID
The Client ID is a unique identifier that distinguishes each MQTT client device or application connected to the broker. It must be unique for each simultaneous connection to the same MQTT broker.

BROKER HOST
Specifies the address (hostname or IP address) of the MQTT server (broker) the client should connect to.

BROKER PORT
Specifies the broker port to connect to

USE WEBSOCKETS
Allows you to activate MQTT communication via Websockets

KEEP ALIVE INTERVAL [s]
This parameter defines Keep alive which ensures that the connection between the broker and client is still open and that the broker and client are aware that they are connected. When the client establishes a connection to the broker, it tells the broker a time interval in seconds. This interval defines the maximum period of time during which the broker and client may not communicate with each other.

CLEAN SESSION
This parameter defines the "clean session". When the clean session flag is set to true, the client does not want a persistent session. If the client disconnects for any reason, all information and messages queued from a previous session are lost.

MESSAGE RETAIN
Usually if a publisher publishes a message on a topic to which no one is subscribed, the message is simply discarded by the broker. However, the publisher can tell the broker to keep the last message of that topic.

QUALITY OF SERVICE [QOS]
This parameter defines the QOS of the MQTT protocol.
Can be selected from
QOS 0 (once only, without ack)
QOS 1 (at least once, with ack)
QOS 2 (once only, with ack and resend)

AUTHENTICATION

This parameter defines whether user/password authentication should be used to access the cloud

AUTHENTICATION USER
Broker or server username

AUTHENTICATION PASSWORD
Broker or server password

SSL/TLS
Defines whether to enable the SSL/TLS 1.2 encrypted security protocol

CLIENT CERTIFICATE REQUIRED
Defines whether to manage x.509 certificates for the SSL/TLS connection

CLIENT CERTIFICATE VALIDITY CHECK
If activated, it verifies the certificates are valid

LOG ON CHANGE
Updates values on broker or server only upon change and no longer over time

PUBLISH MULTIPLE TAGS
This parameter defines whether the publish contains multiple tags or whether the device should send a publish for each tag.

PUBLISH TOPIC FOR LOGS
Selects the topic name for the logs using the following table:

%c	Device Client ID
%m	Device MAC Address
%M	Device MAC Address without dot separator
%j[field]	Adds double quotes " to [field]. The double quotes represent a string in JSON

For example:

If:
Device Client ID = Padova13
Publish Topic for Logs = Seneca/%c/data

The data logs will be sent to the topic:Seneca/Padova13/data

PUBLISH PAYLOAD FOR LOGS
Selects the format to be used for the payload of the data datalogger using the following table:

%c	Device Client ID
%m	Device MAC Address

%M	Device MAC Address without dots
%d	date-time
%t	timestamp (number of seconds from 01/01/1970)
%u	timestamp (number of milliseconds from 01/01/1970)
%b	bulk (format specified in "Publish Bulk Format")
%f	Inserts an ID instead of the variable name (see table)
%n	Tag name (only for "Publish Bulk Format")
%v	Tag value (only in "Publish Bulk Format")
%j[field]	Adds double quotes " to [field]. The double quotes represent a string in JSON

Note: the %f placeholder adds a unique ID to the variable to be published according to the following table:

%m	Device MAC Address
%M	Device MAC Address without dots
%d	date-time
%t	timestamp (number of seconds from 01/01/1970)

%c	Device Client ID
%m	Device MAC Address

%M	Device MAC Address without dot separator
%j[field]	Adds double quotes " to [field]. The double quotes represent a string in JSON

PUBLISH PAYLOAD FOR EVENT
Selects the format to be used for the payload using the following table:

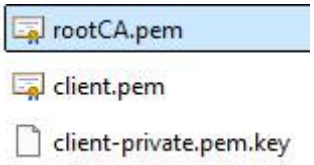
%c	Device Client ID
%m	Device MAC Address
%M	Device MAC Address without dots
%d	date-time
%t	timestamp (number of seconds from 01/01/1970)
%u	timestamp (number of milliseconds from 01/01/1970)
%x	Text of the event
%j[field]	Adds double quotes " to [field]. The double quotes represent a string in JSON

SUBRSCRIBE TOPIC FOR COMMANDS

indicates the MQTT topic on which to send commands to the device *using the following table:*

%c	Device Client ID
%m	Device MAC Address
%M	Device MAC Address without dot separator
%j[field]	Adds double quotes " to [field]. The double quotes represent a string in JSON

The uploaded certificates must have the following names and extensions:



ROOT CA CERTIFICATE FILE (.crt)
File representing the Root CA Certificate (public key + CA signature) of the broker in .crt format

SERVER CERTIFICATE FILE (.crt)
File representing the Client Certificate in .crt format, it is generated by the broker passing the client's public key

CLIENT PRIVATE KEY FILE (.key)
File that represents the private Client key in .key format.

PUBLISH PAYLOAD FOR EVENT

Selects the format to be used for the payload using the following table:

%c	Device Client ID
%m	Device MAC Address
%M	Device MAC Address without dots
%d	date-time
%t	timestamp (number of seconds from 01/01/1970)
%u	timestamp (number of milliseconds from 01/01/1970)
%x	Text of the event
%j[field]	Adds double quotes " to [field]. The double quotes represent a string in JSON

16.11. *SYSTEM CONNECTION SECTION -> P2P*

P2P SERVER PORT (MODBUS models only) (default: 50026)

Sets the communication port for the P2P server.

16.12. *ANALOG AND DIGITAL OUTPUT SETUP SECTION*

ANALOG OUTPUT RETRANSMITTED PHASE

Selects which phase is brought to the analog output (selectable between L1, L2, L3)

ANALOG OUTPUT RETRANSMITTED VALUE

Selects which variable is brought to the analog output (selectable between voltage TRUE RMS, current TRUE RMS, active power, power factor, reactive factor, apparent power, frequency)

DIGITAL OUTPUT LOGIC

Selects the output logic (normally high or low).

DIGITAL OUTPUT FUNCTION

Select the type of function the digital output is to perform.
You can choose from:

Energy Direction

It outputs the polarity (+/-) of the active power via the digital output.

Counter

Generates a pulse when the selected variable increases.

Event

This is triggered if the event specified in the data logger section occurs.

Return Event

This is triggered when the output from the event specified in the data logger section occurs.

Current Overload

It is activated if the current exceeds the set peak value.

Manual

The digital output is controlled by a Modbus register.

Event State

It is activated if the event specified in the data logger section occurs, and deactivated if the event specified in the data logger section ends.

DIGITAL OUTPUT SOURCE

Select the variable to be sent to the digital output..

16.13. *INPUT DIGITAL SETUP SECTION*

DIGITAL INPUT 1 MODE

Selects the behaviour of digital input 1 if input or start/stop for the data logger.
In the "start/stop data logger" mode, when the digital input goes high the data logger starts recording (start), when the digital input goes low the data logger stops (stop).

DIGITAL INPUT 2 MODE

Selects the behaviour of digital input 2 if input or start/stop for the data logger.
In the "start/stop data logger" mode, when the digital input goes high the data logger starts recording (start), when the digital input goes low the data logger stops (stop).

DIGITAL INPUT FILTER [ms]

Sets the filter time for digital inputs, used as filtering for counters.CONNECTIONS DIAGNOSTIC SECTION
In this section you can check if the connection to the device has been made correctly.

It is also possible to exchange the CURRENT - VOLTAGE relationship of each phase without rewiring the system.
In the case of particular connections, the CONNECTION DIAGNOSTIC parameter can be configured to "DISABLE" so that the system ignores connection errors.

MQTT STATUS

Indicates the status of the MQTT communication with the date/time of the last successful communication.

CA CERTIFICATE FILE (.crt)

File that represents the Root CA Certificate

CLIENT CERTIFICATE FILE (.crt)

File that represents the Client Certificate

CLIENT KEY FILE (.key)

File that represents the Client key

17. DEVICE CONFIGURATION VIA WEBSERVER (ETHERNET/IP, PROFINET IO, OPC-UA PROTOCOL MODELS ONLY)

To configure the device, access the web server and select the section you are interested in.
After a modification to the configuration has been made, the changes must be confirmed with the "***APPLY***" button entering the administrator account and password.
The ***Reboot*** button reboots the device (not necessary in the event of a configuration change).
The ***Default*** button returns all the page parameters to the default settings.

17.1. COMMUNICATION SETUP SECTION

DHCP (ETH) (default: Disabled)
Sets the DHCP client to get an IP address automatically.

IP ADDRESS STATIC (ETH) (default: 192.168.90.101)
Sets the device static address. Careful not to enter devices with the same IP address into the same network.

IP MASK STATIC (ETH) (default: 255.255.255.0)
Sets the mask for the IP network.

GATEWAY ADDRESS STATIC (ETH) (default: 192.168.90.1)
Sets the gateway address.

DNS (default: 8.8.8.8)
Set the Domain Name System.

PROTECT CONFIGURATION (default: Disabled)
Allows you to enable or disable password protection for reading and writing the configuration (including the IP address) using the Seneca Discovery Tool. The password is the same one that allows accessing the web server.

⚠ ATTENTION!

IF THE CONFIGURATION PROTECTION IS ENABLED IT WILL BE IMPOSSIBLE TO READ/WRITE THE CONFIGURATION OF THE DEVICE WITHOUT KNOWING THE ADMINISTRATOR PASSWORD.
IF THE PASSWORD IS LOST, IT WILL BE POSSIBLE TO RETURN THE DEVICE TO DEFAULT USING THE DIP SWITCHES

WEBSERVER ACCOUNT NAME (default: admin)
Sets the user name to access the web server.

USER ACCOUNT CONFIGURATION/WEBSERVER PASSWORD (default: admin)
Sets the password to access the webserver and to read/write the configuration (if enabled).

WEB SERVER PORT (default: 80)
Sets the communication port for the web server.

17.2. *MEASURES SETUP SECTION*

CONNECTION TYPE
Sets the type of connection to make.

CT TYPE
Selects the type of sensor and the value of the TA secondary to be used between:
TA with current output
TA with MV output
Rogowski sensor

CT RATIO
Sets any TA ratio, the value to enter is related to the primary, example:
If a 50/5 TA has been installed, the value 50 must be entered as primary with the value 5 on the "TA TYPE" parameter.

VT TYPE
Sets the type of voltage transformer

NETWORK FREQUENCY [Hz]
Sets the system to 50 or 60 Hz.

AVERAGE POWER WINDOW
Sets the time on which to measure the average values

USER CALIBRATION VOLTAGE
Sets a possible multiplication coefficient for the voltage measurement.

USER CALIBRATION CURRENT
Sets a possible multiplication coefficient for the current measurement.

CUTOFF CURRENT [A]
Sets a current value (on the primary) below which counters are stopped.

USER CALIBRATION ACTIVE ENERGY
Sets a possible multiplication coefficient for the active energy.

USER CALIBRATION REACTIVE ENERGY
Sets a possible multiplication coefficient for the reactive energy.

ANALOG OUTPUT TYPE
Selects the type of analog output between voltage and current

17.3. *CONNECTION DIAGNOSTIC SECTION*

In this section you can check if the connection to the device has been made correctly.
It is also possible to exchange the CURRENT - VOLTAGE relationship of each phase without rewiring the system.
In the case of particular connections, the CONNECTION DIAGNOSTIC parameter can be configured to "DISABLE" so that the system ignores connection errors.

17.4. *OPC-UA CONFIGURATION SECTION (OPC-UA PROTOCOL MODELS ONLY)*

MAX FAILURE COUNTER
Maximum number of errors before waiting the time of the "WAIT AFTER FAILURE" parameter

SERVER NAME
Name that identifies the server

SERVER PORT
Server port

AUTHENTICATION
Establishes whether or not to activate authentication with username and password

USERNAME
Username to be used if authentication is active

PASSWORD
Password be used if authentication is active

OPC-UA SERVER SECURITY POLICY
Set the server security policy, you can choose between:

BASIC128RSA15
BASIC256
BASIC256SHA256
AES128SHA256RSAOAEP

OPC-UA SERVER MESSAGE SECURITY MODE
Select between:
NONE

SIGN
SIGN AND ENCRYPT

18. *DOWNLOADING THE DATALOGGER FILES (MODBUS PROTOCOL MODELS ONLY)*

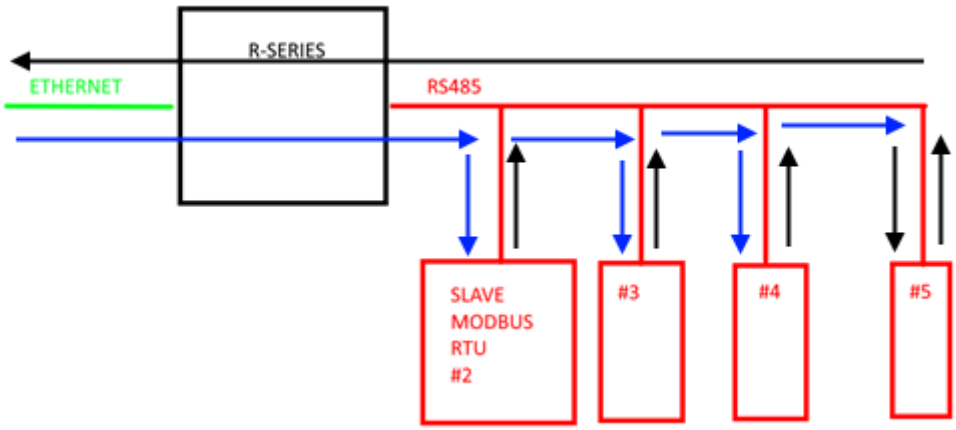
In the "Data logger view" section you can download the entire timed database in csv text format.
In the "Data logger event view" section you can download the entire event database in csv text format.

ATTENTION!

THE TEXT FILES DOWNLOADED BY THE DATA LOGGER HAVE THE DEFAULT .CGI EXTENSION. TO USE THEM WITH EXCEL-TYPE SOFTWARE IT IS POSSIBLE TO RENAME THEM AS .CSV

19. MODBUS PASSTHROUGH (MODBUS PROTOCOL MODELS ONLY)

Thanks to the Modbus Passthrough function it is possible to extend the amount of I/O available in the device via the RS485 port and the Modbus RTU slave protocol, for example by using the Seneca Z-PC series products.
In this mode the RS485 port stops working as Modbus RTU slave and the device becomes a Modbus TCP-IP gateway to Modbus RTU serial:



Each Modbus TCP-IP request with station address other than that of the R series device is converted into a serial packet on the RS485 and, in the case of a reply, it is turned over to TCP-IP.
Therefore, it is no longer necessary to purchase gateways to extend the I/O number or to connect already available Modbus RTU I/O.

20. FIRMWARE UPDATE

In the “Update” section of the Webserver it is possible to update the firmware using a binary file that can be downloaded directly from the Seneca website in the download section of the device.

ATTENTION!

BEFORE UPDATING THE FW, STOP COMMUNICATION WITH THE PLC CONNECTED TO THE DEVICE (FOR EXAMPLE BY DISCONNECTING THE ETHERNET CABLE) OTHERWISE THE COMMUNICATION WITH THE PLC WILL PREVENT THE CORRECT SENDING OF THE FIRMWARE AND THE PROCEDURE WILL NOT BE SUCCESSFUL.

21. RESETTING THE DEVICE TO ITS FACTORY CONFIGURATION

The factory configuration resets all parameters to default.

To reset the device to the factory configuration it is necessary to follow the procedure below:

1) Remove power from the device
2) Turn dip switches 1 and 2 to ON
3) Power up the device and wait at least 10 seconds
4) Turn dip switches 1 and 2 to OFF
5) At the next restart the device will have loaded the factory configuration

ATTENTION!

RESTORING TO FACTORY DEFAULT DELETES ANY ACQUIRED LOGS AND ALL CONFIGURATIONS. BE SURE TO SAVE THE CURRENT CONFIGURATION AND LOG FILE BEFORE PERFORMING THIS OPERATION.

22. MODBUS COMMUNICATION PROTOCOL (MODBUS PROTOCOL MODELS ONLY)

The supported communication protocol is:

- Modbus RTU Slave (from the RS485 port)
- Modbus TCP-IP Server (from Ethernet ports)

The Modbus TCP-IP Server supports up to 8 concurrent clients.

For more information on these protocols, see the website:
http://www.modbus.org/specs.php.

22.1. SUPPORTED MODBUS FUNCTION CODES

The following Modbus functions are supported:

- Read Holding Register (function 3)
- Write Single Register (function 6)
- Write Multiple registers (function 16)

ATTENTION!

All 32-bit values are contained in 2 consecutive registers

ATTENTION!

All 64-bit values are contained in 4 consecutive registers

ATTENTION!

Any registers with RW* (in flash memory) can be written up to about 10000 times
The PLC/Master Modbus programmer must not exceed this limit

22.2. MODBUS REGISTER TABLE

The following abbreviations are used in the register tables:

MS = More significant
LS = Less significant
MSW = Most significant word (16bit)
LSW = Least significant word (16bit)
MMSW = Most "most" significant word (16bit)
LLSW = Least "least" significant word (16bit)
MSW = 8 most significant bits
LSB = 8 least significant bits
MSBIT = Most significant bit
MSBIT = Least significant bit
RO = Register in read-only
RW = Read/write register
RW** = Reading and writing register contained in flash memory, writable a maximum of 10000 times.
Unsigned 16 bit = unsigned integer register, can take values from 0 to 65535
Signed 16 bit = signed integer register can take values from -32768 to +32767
Float 32 bits = 32-bit single-precision floating point register (IEEE 754) https://en.wikipedia.org/wiki/IEEE_754
BIT = Boolean registry, can be 0 (false) or 1 (true)

22.3. NUMBERING OF "0-BASED" OR "1-BASED" MODBUS ADDRESSES

According to the Modbus standard the Holding Register registers are addressable from 0 to 65535, there are 2 different conventions for numbering the addresses: "0-BASED" and "1-BASED".
For greater clarity, Seneca shows its register tables in both conventions.

ATTENTION!

CAREFULLY READ THE DOCUMENTATION OF THE MODBUS MASTER DEVICE IN ORDER TO UNDERSTAND WHICH OF THE TWO CONVENTIONS THE MANUFACTURER HAS DECIDED TO USE

22.4. NUMBERING OF MODBUS ADDRESSES WITH "0-BASED" CONVENTION

The numbering is:

HOLDING REGISTER MODBUS ADDRESS (OFFSET)	*MEANING*
0	FIRST REGISTER
1	SECOND REGISTER
2	THIRD REGISTER
3	FOURTH REGISTER
4	FIFTH REGISTER

Therefore, the first register is at address 0.
In the following tables, this convention is indicated with ***"ADDRESS OFFSET".***

22.5. NUMBERING OF MODBUS ADDRESSES WITH "1 BASED" CONVENTION (STANDARD)

The numbering is that established by the Modbus consortium and is of the type:

HOLDING REGISTER MODBUS ADDRESS 4x	*MEANING*
40001	FIRST REGISTER
40002	SECOND REGISTER
40003	THIRD REGISTER
40004	FOURTH REGISTER
40005	FIFTH REGISTER

In the following tables this convention is indicated with ***"ADDRESS 4x"*** since a 4 is added to the address so that the first Modbus register is 40001.

A further convention is also possible where the number 4 is omitted in front of the register address:

HOLDING MODBUS ADDRESS WITHOUT 4x	*MEANING*
1	FIRST REGISTER
2	SECOND REGISTER
3	THIRD REGISTER
4	FOURTH REGISTER
5	FIFTH REGISTER

22.6. *BIT CONVENTION WITHIN A MODBUS HOLDING REGISTER*

A Modbus Holding Register consists of 16 bits with the following convention:

BIT 15	BIT 14	BIT 13	BIT 12	BIT 11	BIT 10	BIT 9	BIT 8	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

For instance, if the value of the register in decimal is
12300
the value 12300 in hexadecimal is:
0x300C

the hexadecimal 0x300C in binary value is:
11 0000 0000 1100

So, using the above convention, we get:

BIT 15	BIT 14	BIT 13	BIT 12	BIT 11	BIT 10	BIT 9	BIT 8	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
0	0	1	1	0	0	0	0	0	0	0	0	1	1	0	0

22.7. *MSB and LSB BYTE CONVENTION WITHIN A MODBUS HOLDING REGISTER*

A Modbus Holding Register consists of 16 bits with the following convention:

BIT 15	BIT 14	BIT 13	BIT 12	BIT 11	BIT 10	BIT 9	BIT 8	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

LSB Byte (Least Significant Byte) defines the 8 bits ranging from Bit 0 to Bit 7 included, we define MSB Byte (Most Significant Byte) the 8 bits ranging from Bit 8 to Bit 15 inclusive:

BIT 15	BIT 14	BIT 13	BIT 12	BIT 11	BIT 10	BIT 9	BIT 8	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
BYTE MSB								BYTE LSB							

22.8. REPRESENTATION OF A 32-BIT VALUE IN TWO CONSECUTIVE MODBUS HOLDING REGISTERS

The representation of a 32-bit value in the Modbus Holding Registers is made using 2 consecutive Holding Registers (a Holding Register is a 16-bit register). To obtain the 32-bit value it is therefore necessary to read two consecutive registers:
For example, if register 40064 contains the 16 most significant bits (MSW) while register 40065 contains the least significant 16 bits (LSW), the 32-bit value is obtained by composing the 2 registers:

BIT 15	BIT 14	BIT 13	BIT 12	BIT 11	BIT 10	BIT 9	BIT 8	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
40064 MOST SIGNIFICANT WORD															

BIT 15	BIT 14	BIT 13	BIT 12	BIT 11	BIT 10	BIT 9	BIT 8	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
40065 LEAST SIGNIFICANT WORD															

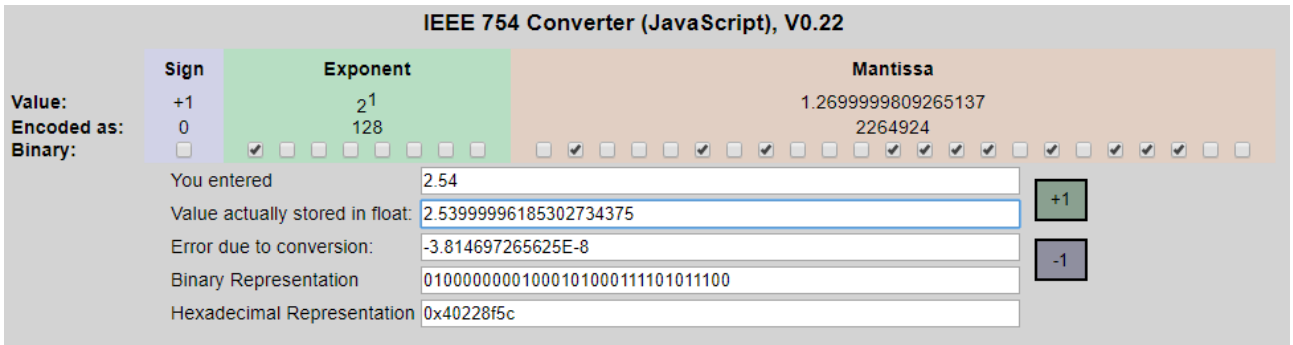
$$Value_{32bit} = Register_{LSW} + (Register_{MSW} * 65536)$$

In the reading registers it is possible to swap the most significant word with the least significant word, therefore it is possible to obtain 40064 as LSW and 40065 as MSW.

22.9. TYPE OF 32-BIT FLOATING POINT DATA (IEEE 754)

The IEEE 754 standard (https://en.wikipedia.org/wiki/IEEE_754) defines the format for representing floating point numbers.
As already mentioned, since it is a 32-bit data type, its representation occupies two 16-bit holding registers.
To obtain a binary / hexadecimal conversion of a floating point value it is possible to refer to an online converter at this address:

http://www.h-schmidt.net/FloatConverter/IEEE754.html



Using the last representation the value 2.54 is represented at 32 bits as:

0x40228F5C

Since we have 16-bit registers available, the value must be divided into MSW and LSW:

0x4022 (16418 decimal) are the 16 most significant bits (MSW) while 0x8F5C (36700 decimal) are the 16 least significant bits (LSW).

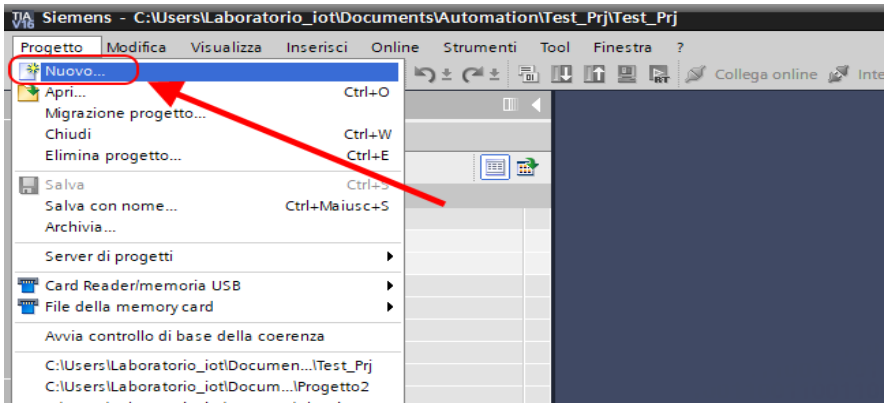
23. PROFINET IO COMMUNICATION PROTOCOL (MODBUS PROTOCOL MODELS ONLY)

Type of protocol: Class A Device, Cyclic Real-time (RT) and Acyclic Data

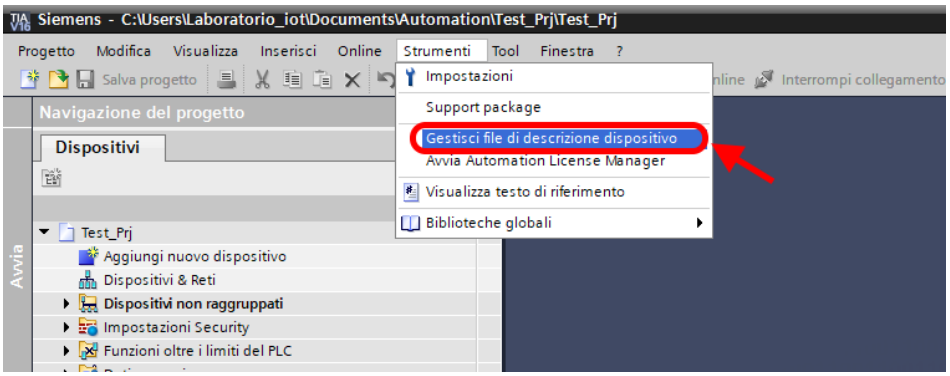
23.1. CREATING A PROJECT WITH SIEMENS PLC (TIA PORTAL 16) (PROFINET IO PROTOCOL MODELS ONLY)

Creating a new project:

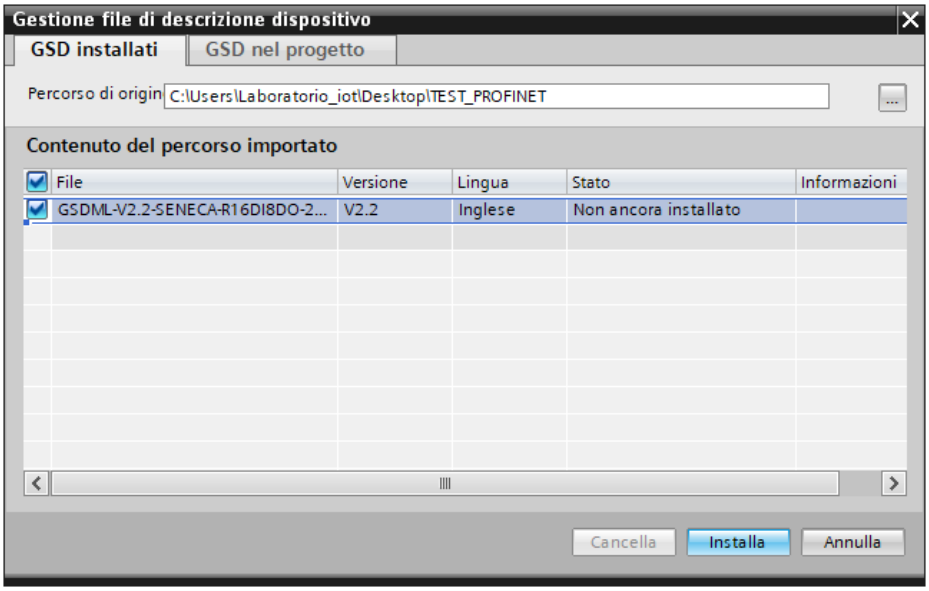


23.1.1. *INSTALLING THE GSDML FILE*

Install the GSDML file of the Seneca product
(it is possible to obtain the file on the web page of the device on the www.seneca.it site):



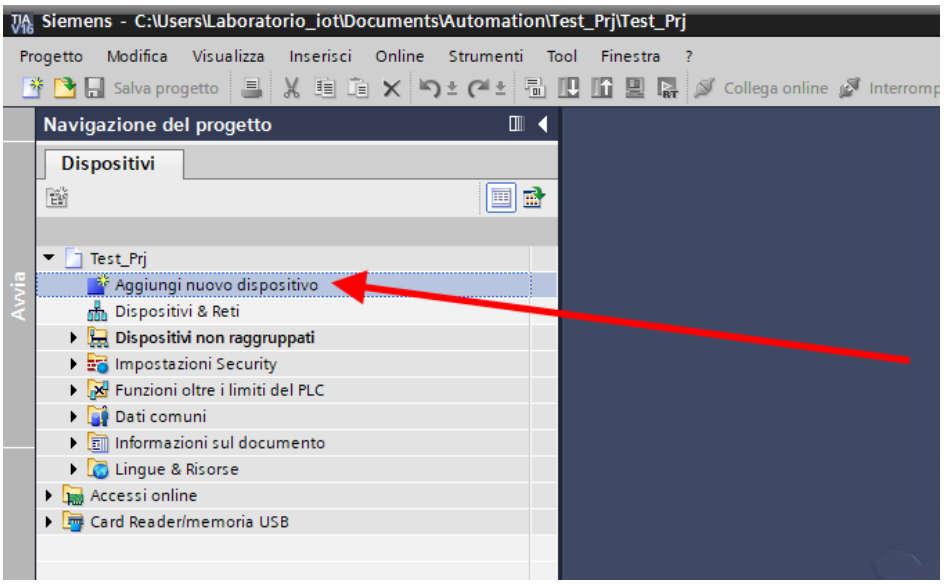
Point to the directory where the file is and press OK, then the list of GSD files in the folder will appear:

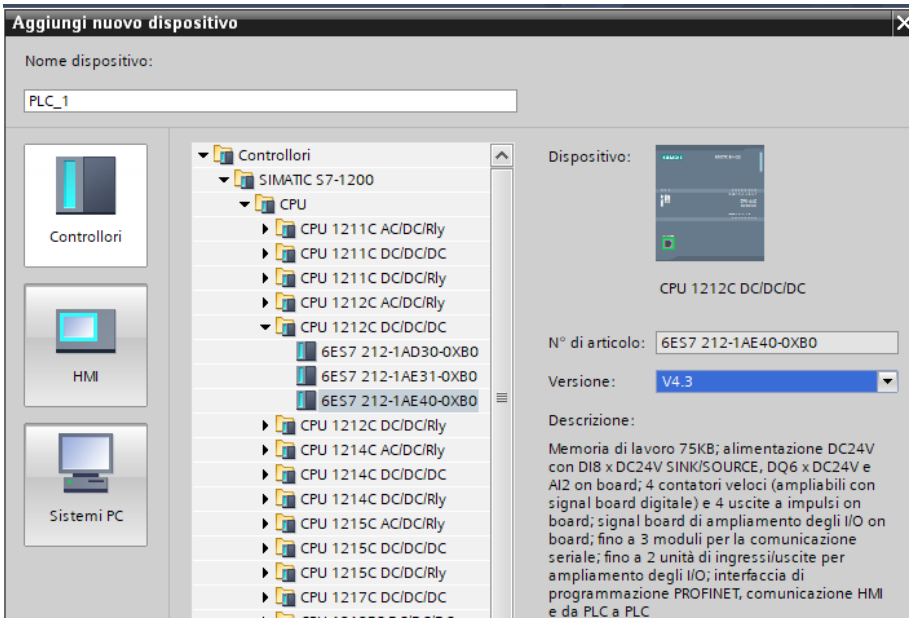


Click on "install".

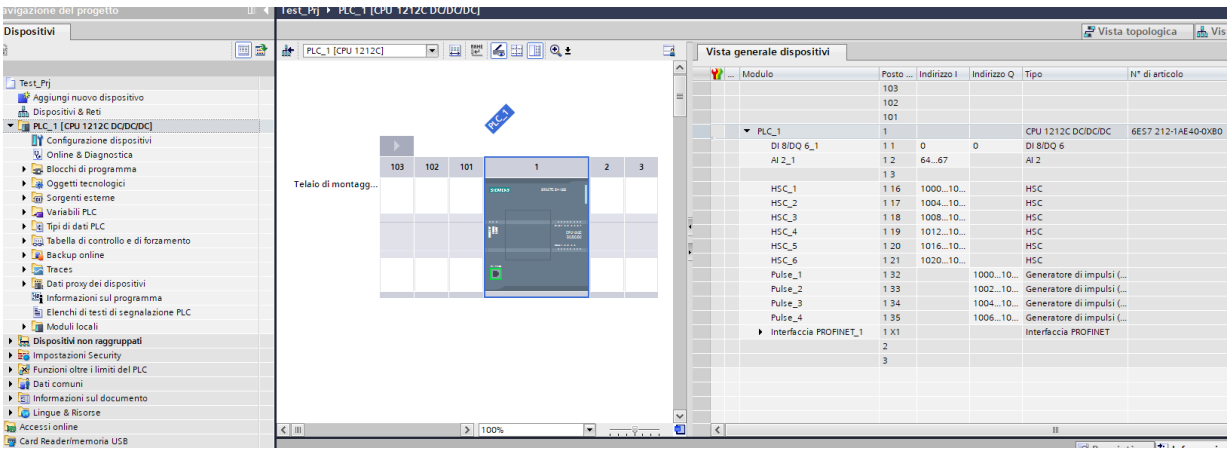
23.1.2. *INSERTION OF THE SIEMENS PLC IN THE PROJECT*

Now insert the Siemens PLC (in our example a SIEMATIC S7 1200), click on "Add new device ...":

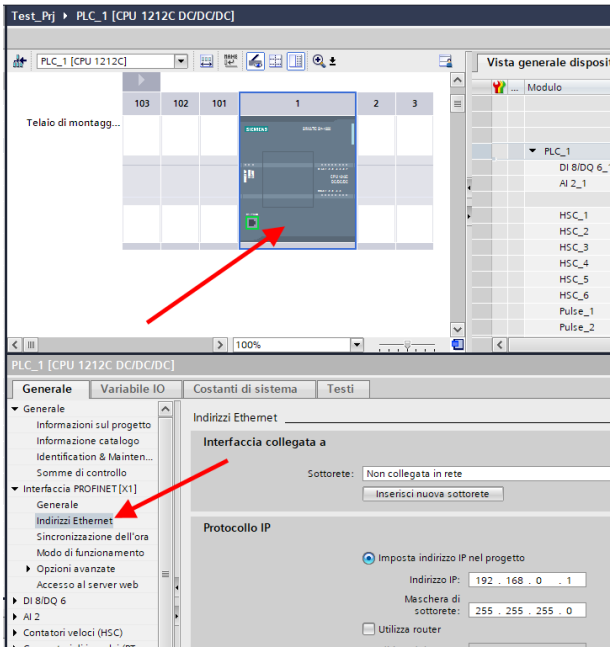




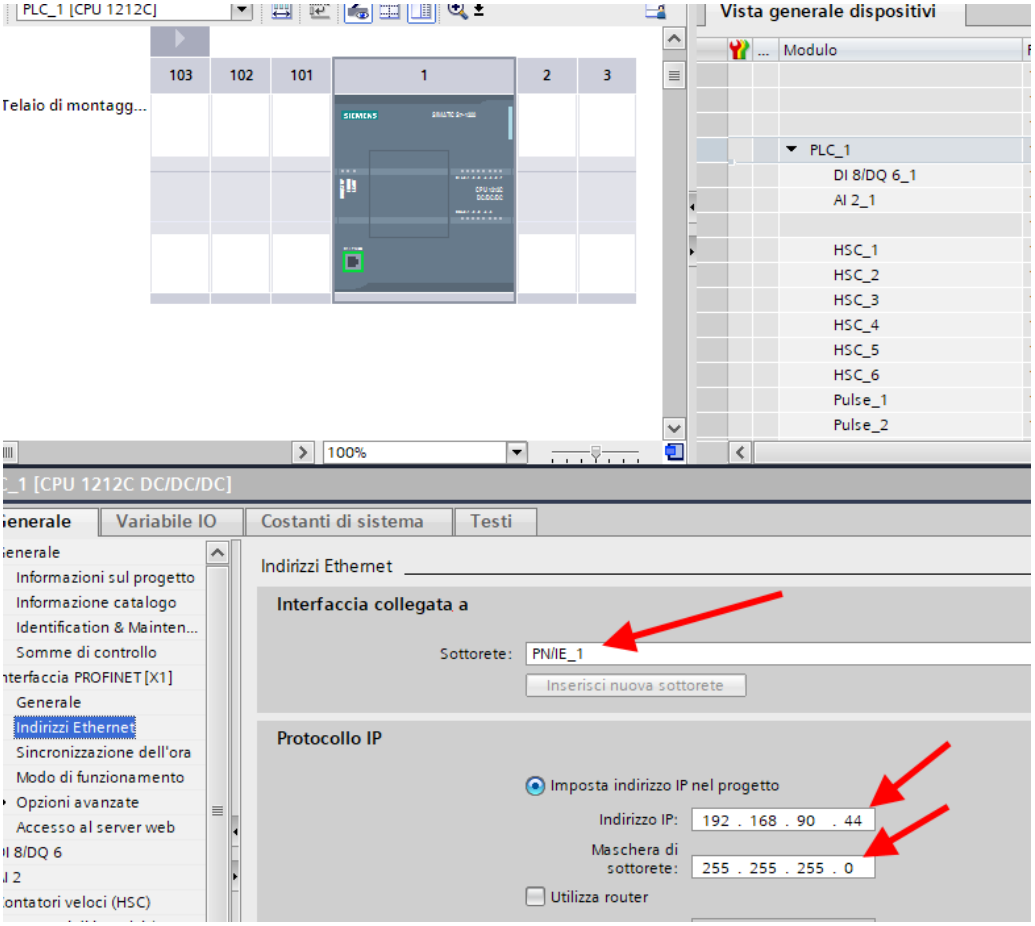
Confirm and the PLC will be added to the rack:



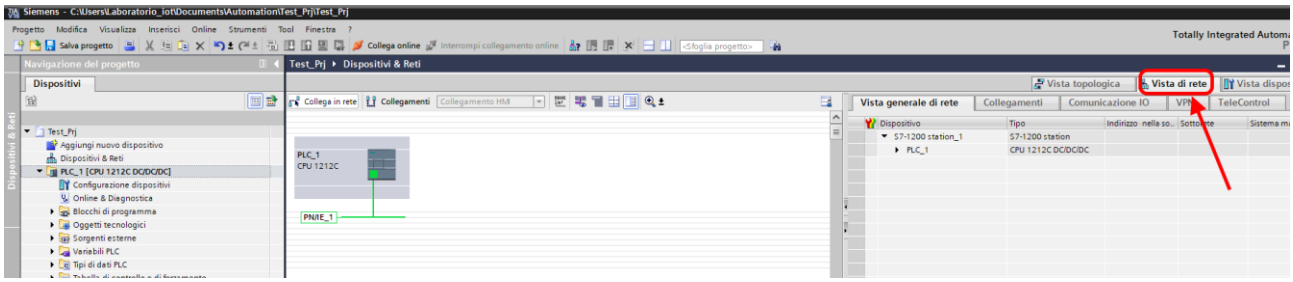
Now click on the PLC and select Profinet interface -> Ethernet addresses



Set the IP you want (in this case 192.168.90.44) and the PLC subnet:

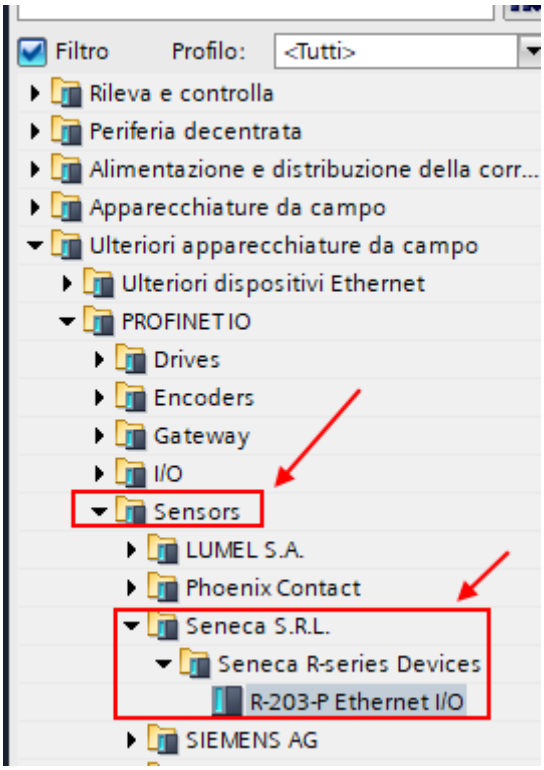


Move on to the network view:

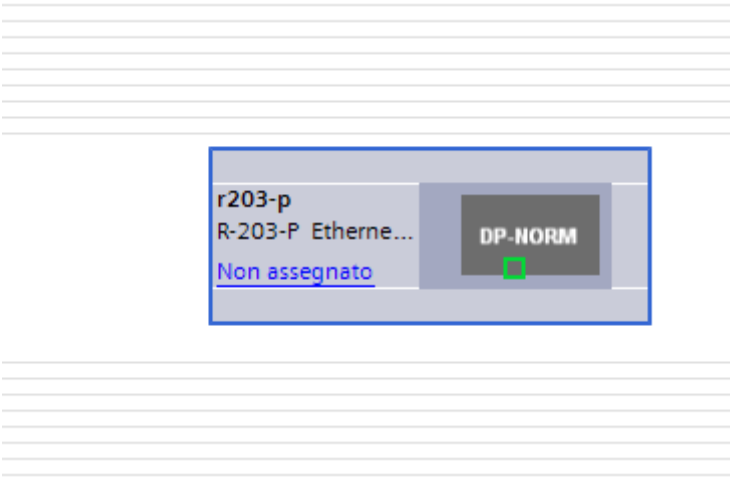


23.1.3. *INSERTION OF THE PROFINET SENECA IO*

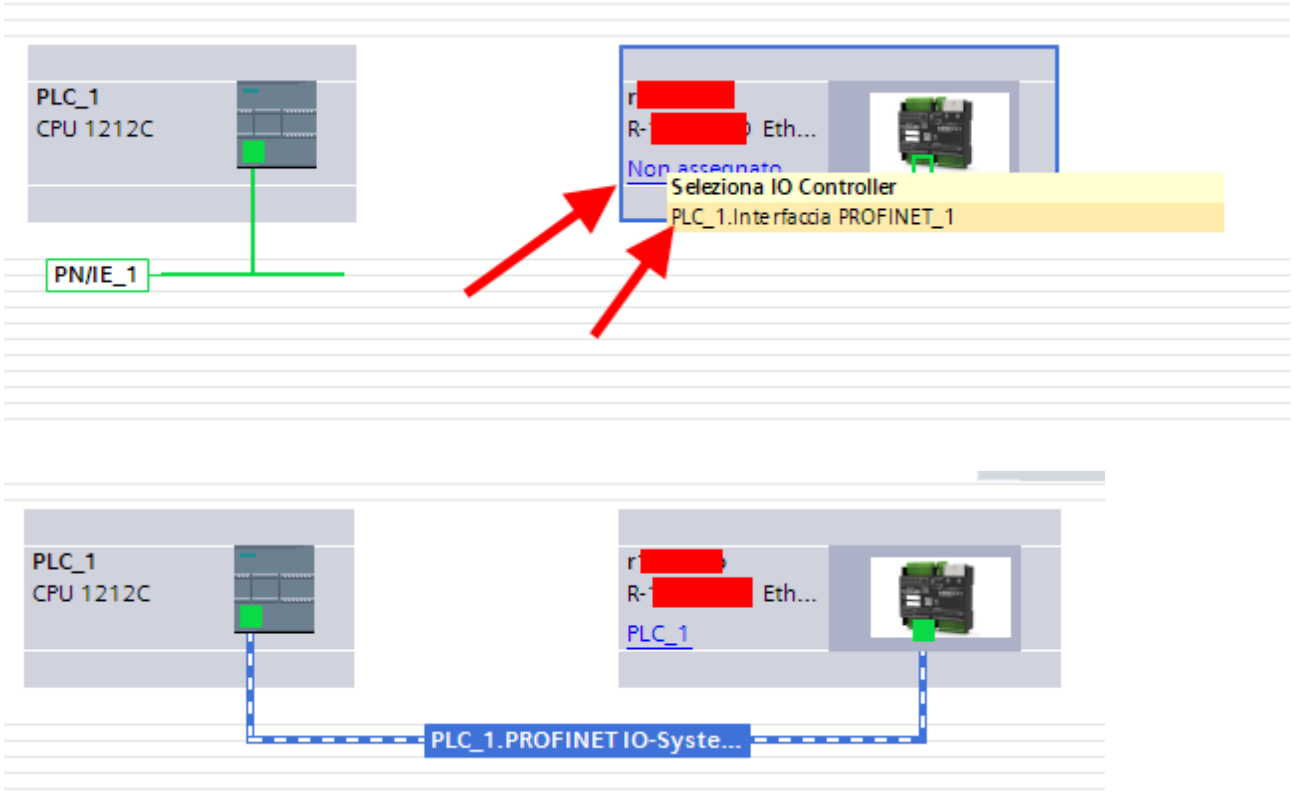
On the right select "Hardware Catalogue" and then under "Additional Field Equipment" -> PROFINET IO -> Sensors -> Seneca S.R.L. -> Seneca R-Series Devices -> R-203-P Ethernet I/O



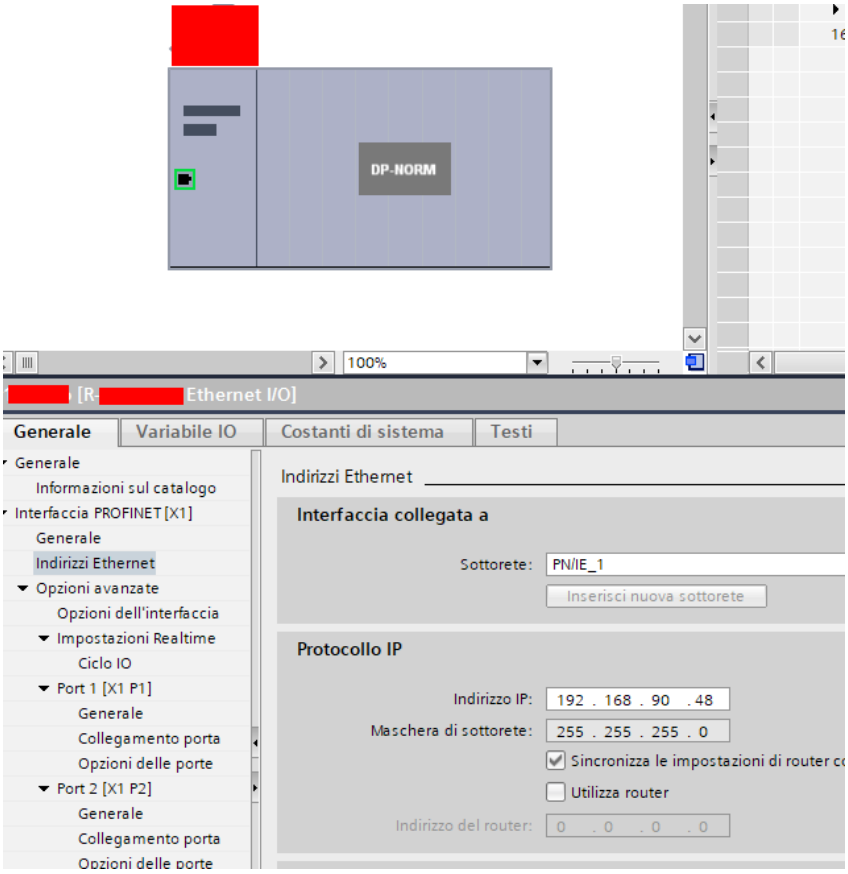
Drag the device to the network view:



Now associate it to the PLC by clicking with the left mouse on "Not assigned" and then select the PLC:



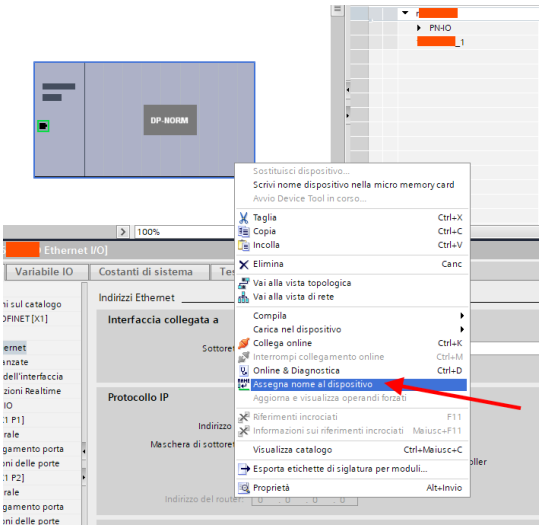
Click twice on the Seneca device and configure the IP address here too (for example 192.168.90.48):



In Profinet the devices are identified by their name, so right click on the Seneca device and select "Assign device name"

ATTENTION!

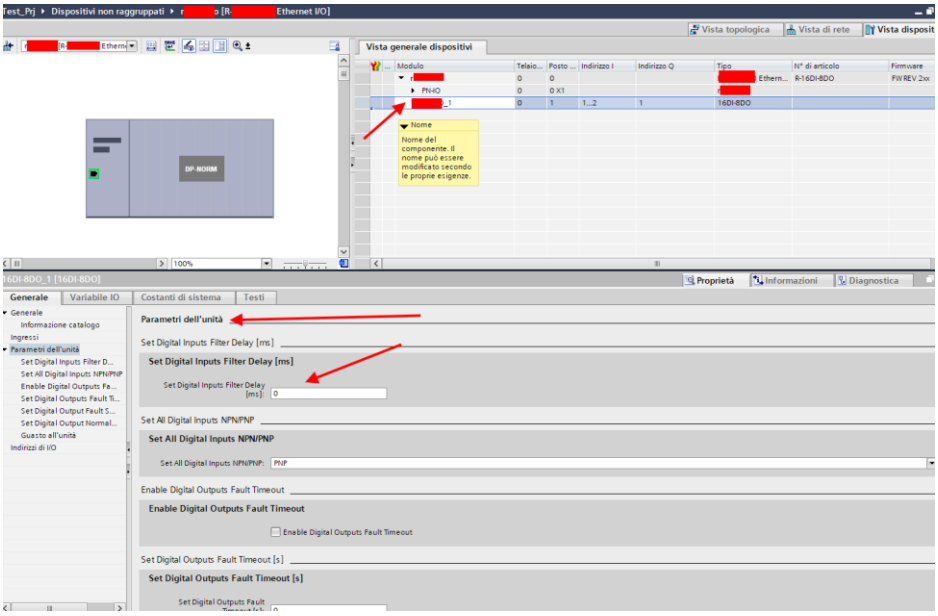
AVOID INSERTING SPECIAL CHARACTERS IN THE PROFINET NAME OF THE DEVICE



Scan the network with "Update list" and set (if necessary) the device name with "Assign name".

23.1.4. *CONFIGURATION OF THE PARAMETERS OF THE SENECA DEVICE*

It is also possible to directly configure the device IO without any external software.
To configure the device, click on the IO so that the "Unit parameters" appear:



At the next start, the PLC will send the desired configuration to the device.

23.1.5. *CONFIGURATION PARAMETERS OF THE GSDML FILE*

CONNECTION TYPE
Sets the type of connection to make.

TA TYPE
Selects the type of sensor and the value of the TA secondary to be used between:
TA with current output
TA with MV output
Rogowski sensor

TA RATIO
Sets any TA ratio, the value to enter is related to the primary, example:
If a 50/5 TA has been installed, the value 50 must be entered as primary with the value 5 on the "TA TYPE" parameter.

TV TYPE
Sets the type of voltage transformer

TV RATIO
Sets the possible TV ratio

NETWORK FREQUENCY [Hz]
Sets the system to 50 or 60 Hz.

AVERAGE POWER WINDOW
Sets the time on which to measure the average values

USER CALIBRATION VOLTAGE
Sets a possible multiplication coefficient for the voltage measurement.

USER CALIBRATION CURRENT
Sets a possible multiplication coefficient for the current measurement.

CUTOFF CURRENT [A]
Sets a current value (on the primary) below which counters are stopped.

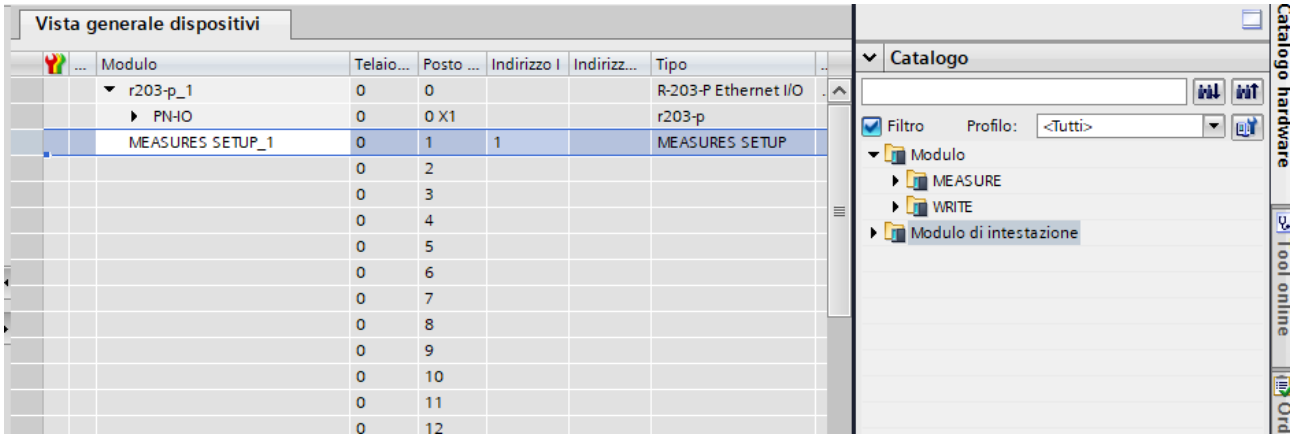
USER CALIBRATION ACTIVE ENERGY
Sets a possible multiplication coefficient for the active energy.

USER CALIBRATION REACTIVE ENERGY
Sets a possible multiplication coefficient for the reactive energy.

AO MODE
Sets whether the analog output is configured in Voltage [0V...10V] or Current [0mA...20mA].
This parameter will be only used for analog output models.

23.1.6. *I/O DATA*

You can now choose which variable groups to publish in Profinet.
Once the device inserted the following will appear:



MEASURE_SETUP is a group of variables that is always present, while on the right there are “MEASURE” and “WRITE” variables.
You can add up to 15 variable groups.

The variable groups are optional, those that can be added are:

MEASURE SETUP (Always present)

Provides general information on the status of the inputs and the device:

Name	Data Type	Display as Bits	Length [Bytes]
STATUS	Unsigned8	Bit 0: CYCLIC PHASE SENSOR ERROR Bit 1: CURRENT CUT OFF Bit 2: CURRENT ERROR L1 Bit 3: CURRENT ERROR L2 Bit 4: CURRENT ERROR L3 Bit 5: LINE 1 VOLTAGE/CURRENT CONNECTION ERROR Bit 6: LINE 2 VOLTAGE/CURRENT CONNECTION ERROR Bit 7: LINE 3 VOLTAGE/CURRENT CONNECTION ERROR	1

For more information on the meaning of these Boolean values, refer to the chapter 15.

VOLTAGE

Provides the values of the phase-to-line and star voltages:

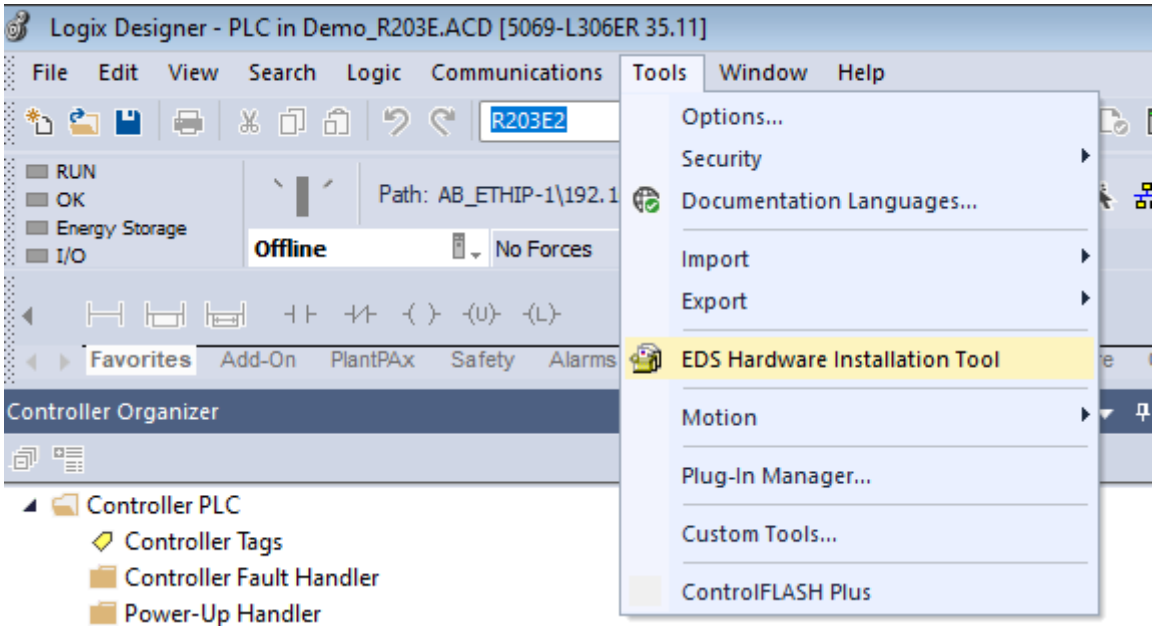
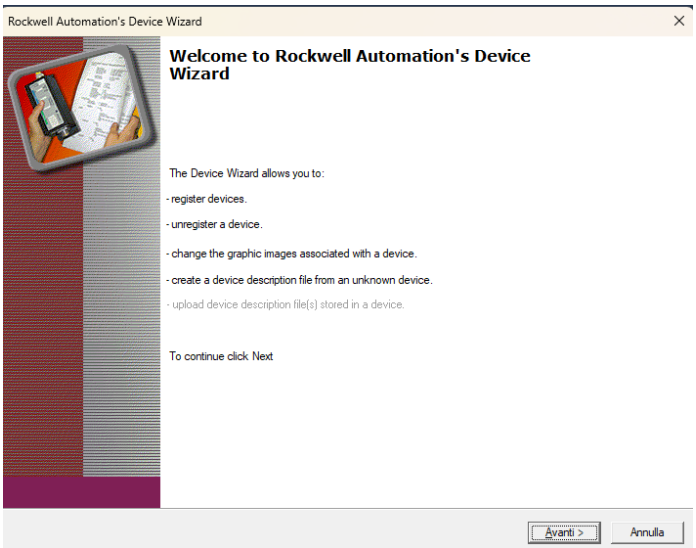
24. ETHERNET/IP COMMUNICATION PROTOCOL (ETHERNET/IP PROTOCOL MODELS ONLY)

EtherNet/IP (Ethernet Industrial Protocol) is an open field bus based on CIP (Common Industrial Protocol), developed by Rockwell Automation and ODVA (Open DeviceNet Vendor Association).

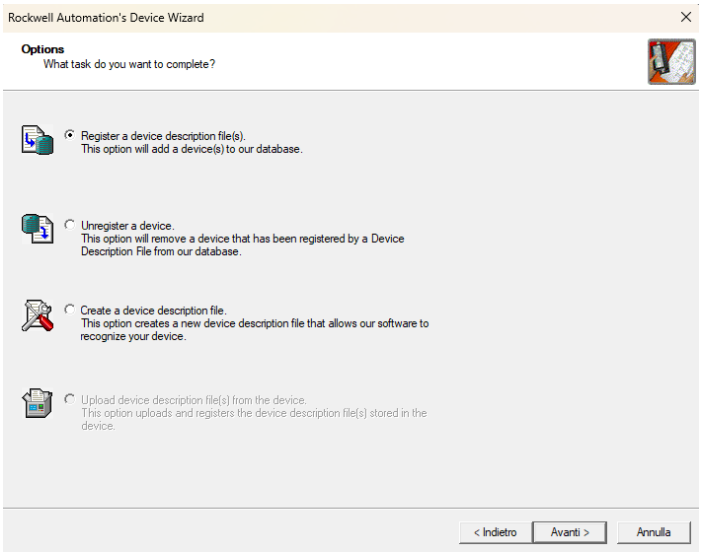
24.1. CREATING A PROJECT WITH PLC ALLEN BRADLEY/ROCKWELL (RS-LOGIX5000 / STUDIO 5000 LOGIX DESIGNER 35.00.00)

Once the PLC has been added to the project, import the EDS file of the device via the Tools-> EDS Hardware Installation Tool menu:

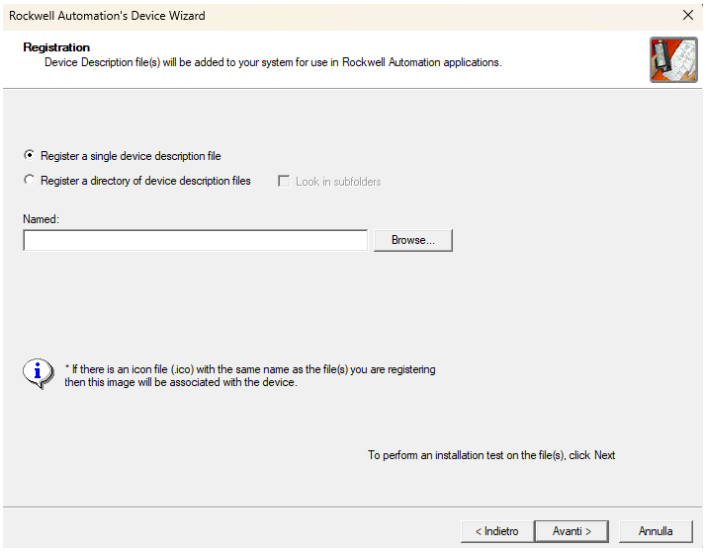


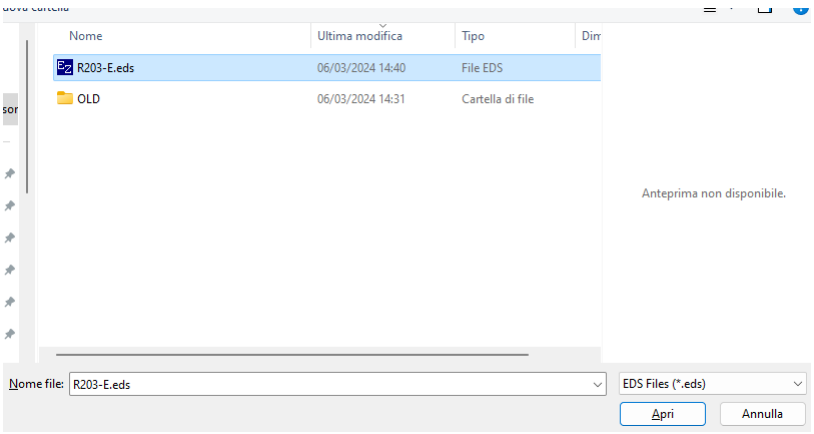


Press “Next”, and select Add a new device:

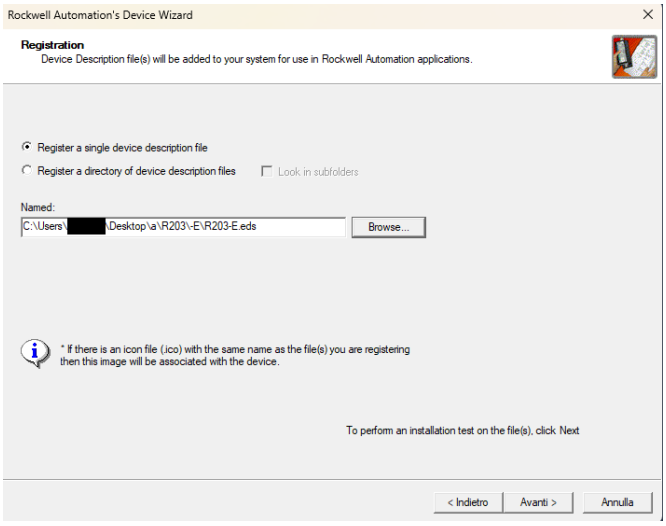


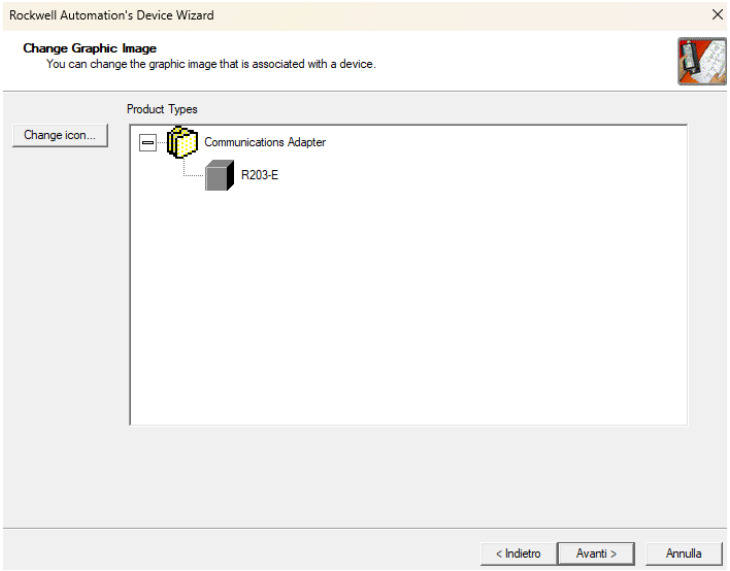
Select to register a single device and select the “R203-E.eds” file





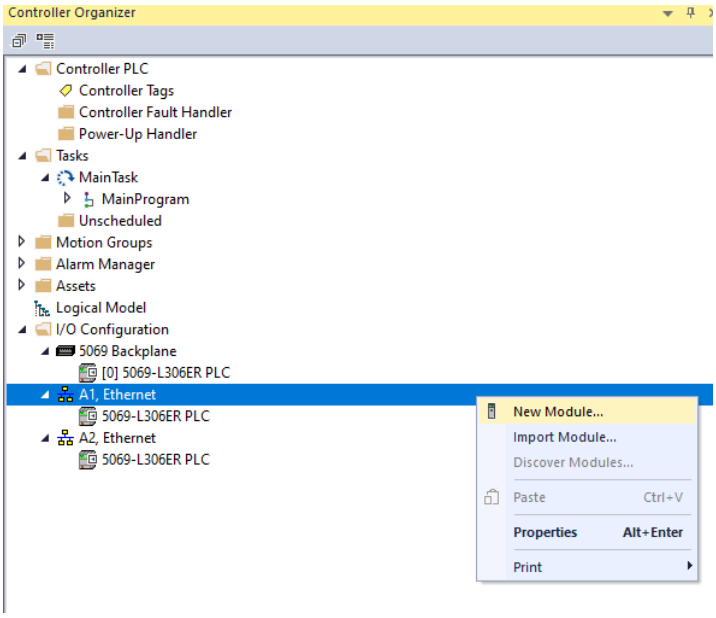
Select “Open” and then “Next”:



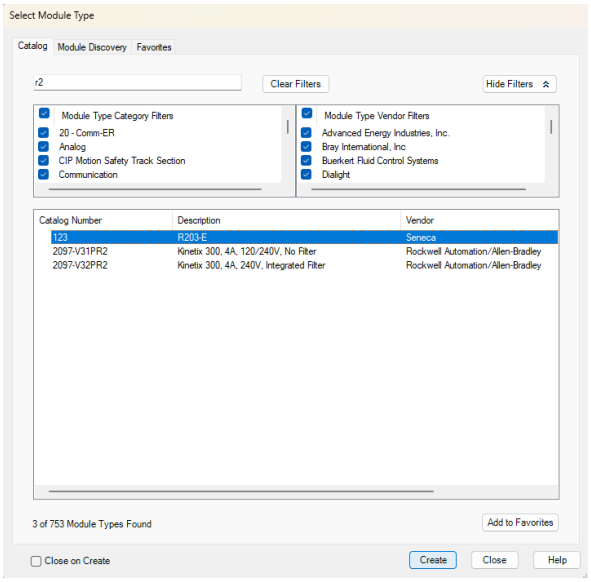


At this point the R203-E product has been entered into the device database.

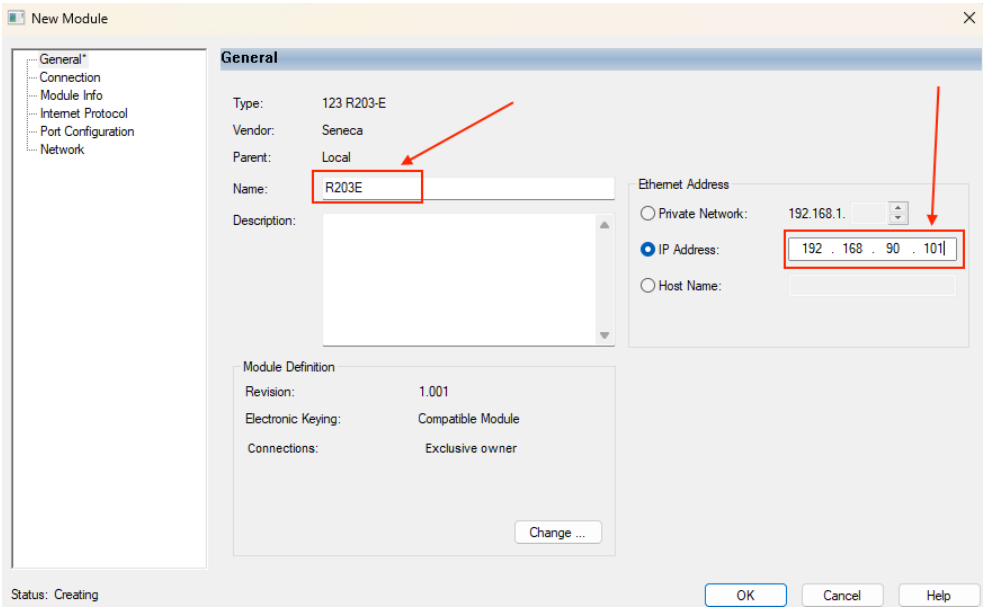
Now go with the mouse over the ethernet port of the PLC connected to the device and with the right button select "New Module...":



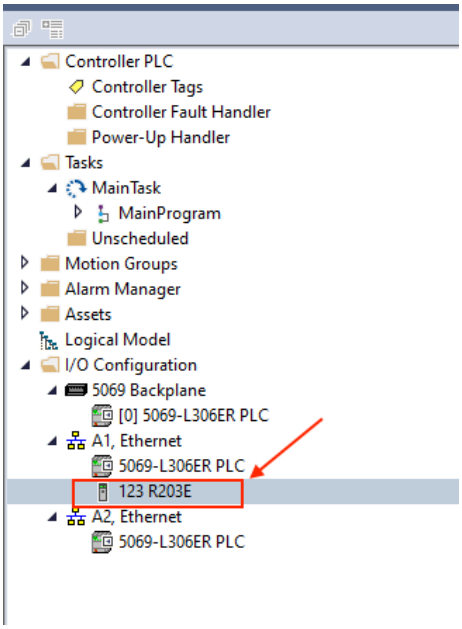
Now select the R203-E device:



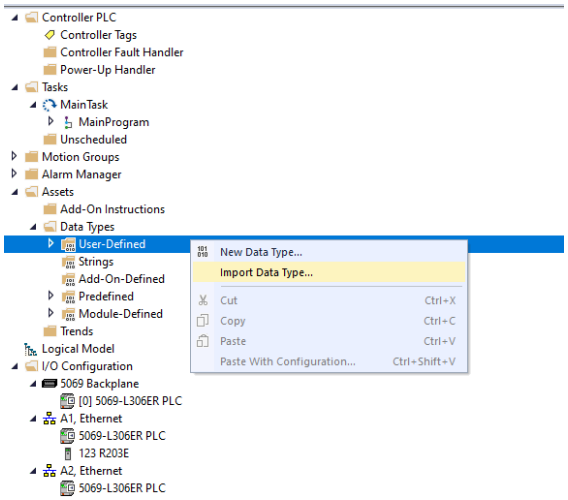
Give the device a name and enter its IP address:

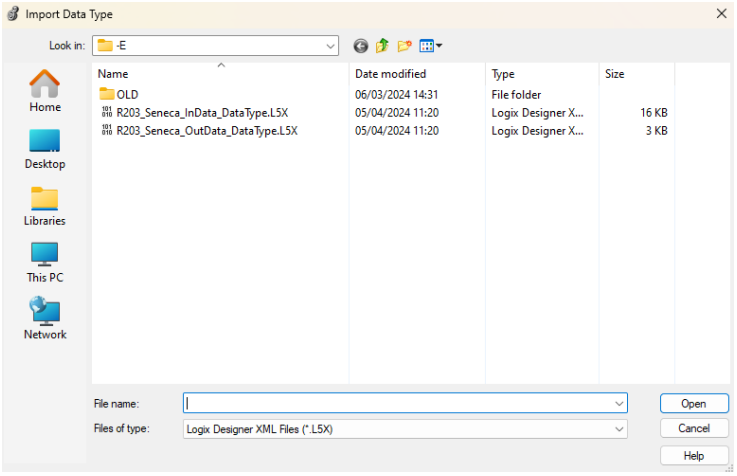


By confirming with OK the device is added:

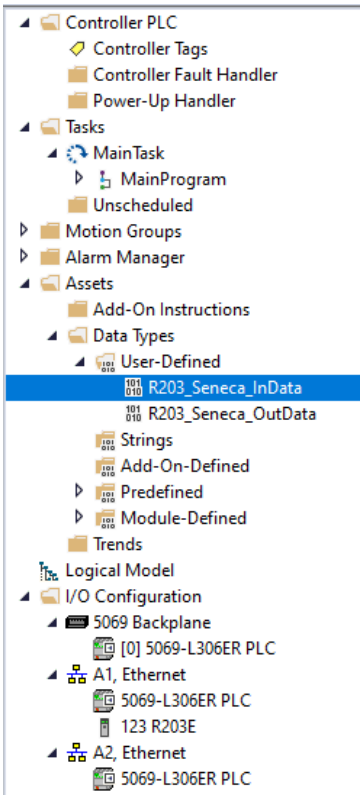


To simplify the acquisition of measurements and sending records to the device, you import the User Data Defined relating to R203-E:

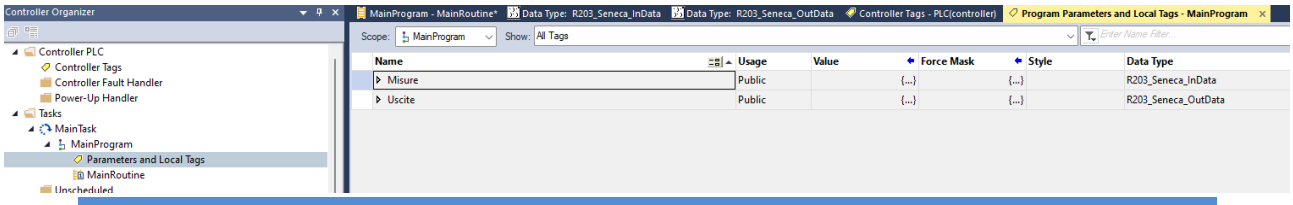




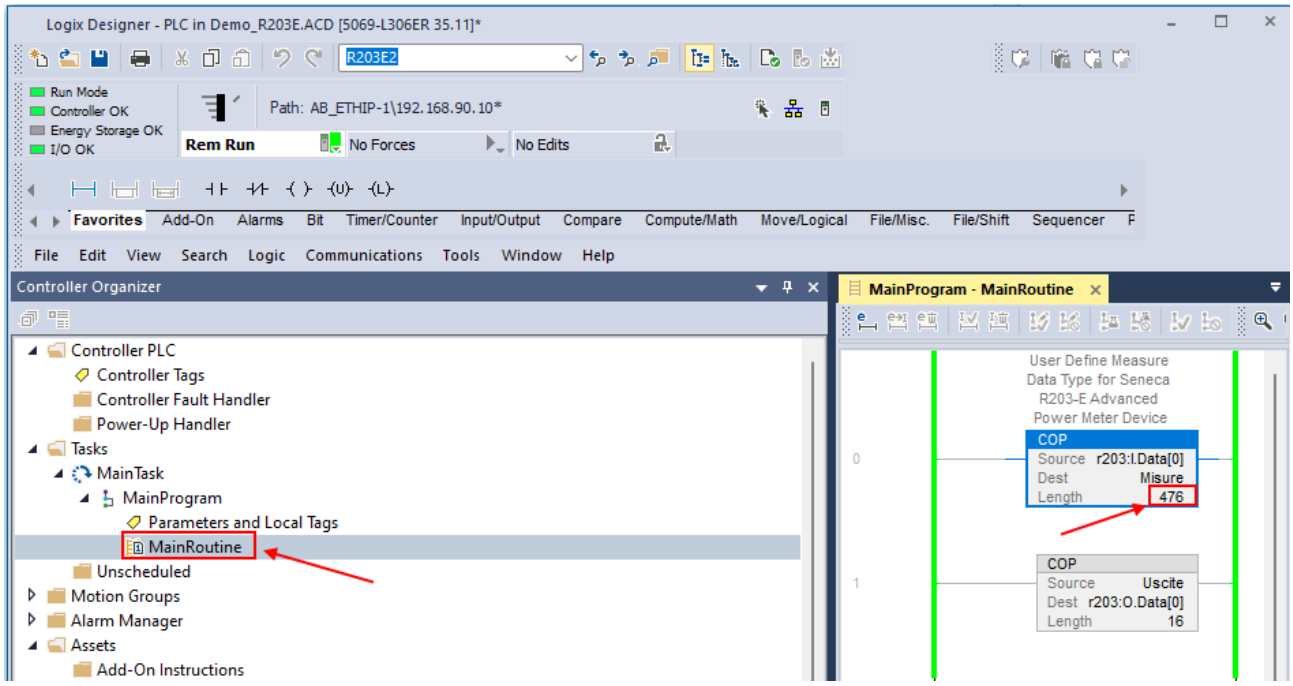
The InData will represent the measurements that come out of the device towards the PLC, OutData are the tags that allow you to send commands to the device:



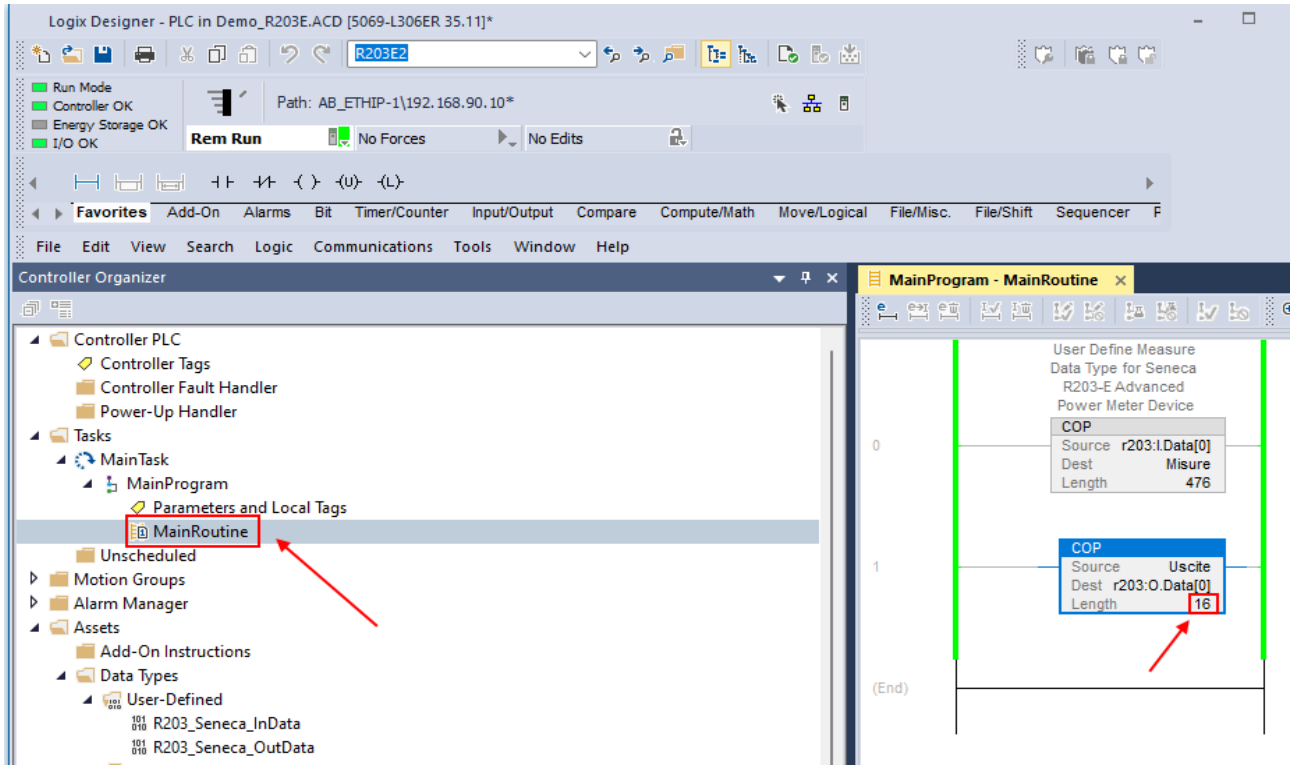
Now define the “Measurements” and “Outputs” with “R203_Seneca_InData” and “R203_Seneca_OutData” data type respectively:



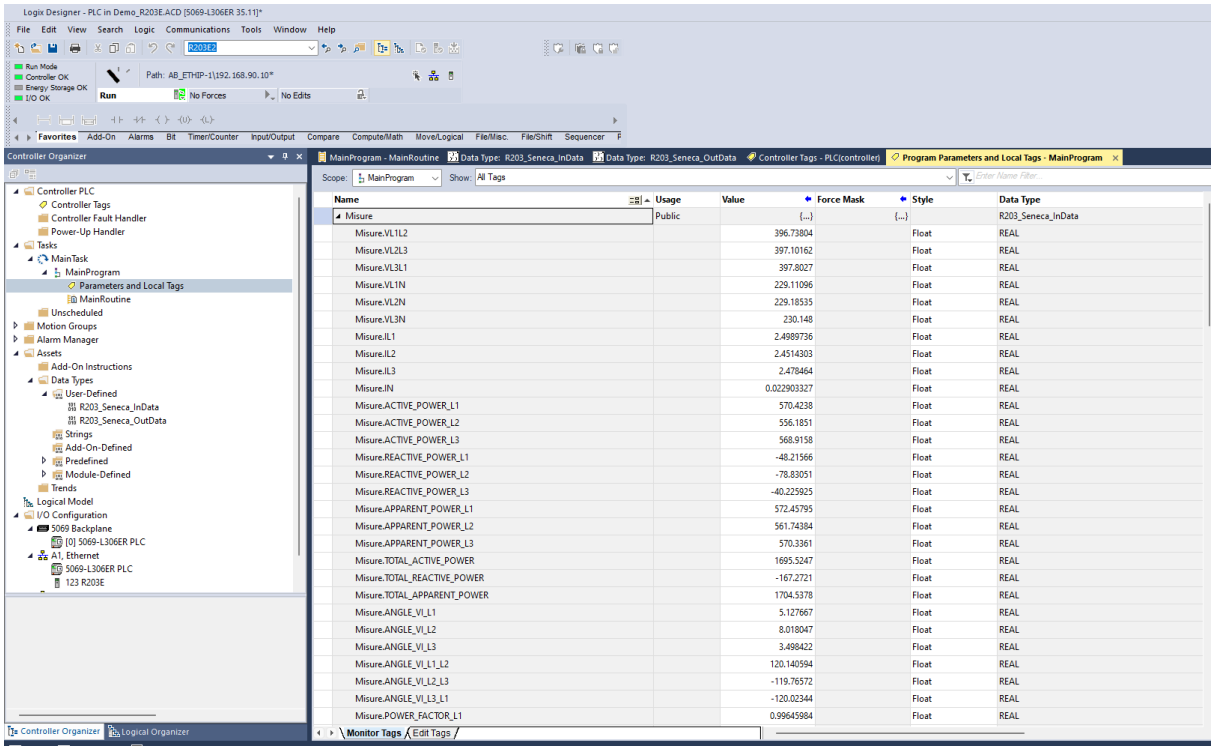
At this point define a program that copies the measurements arriving from R203 into the R203_Seneca_InData structure:



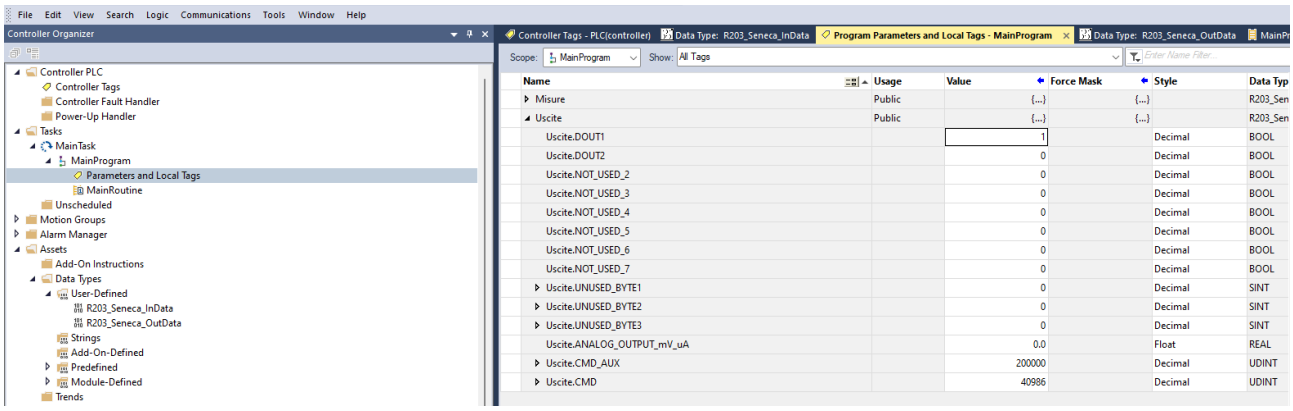
And then copy the values that you will control in the R203_Seneca_OutData structure into the data sent to the device:



Now put the PLC in "Program" mode and download the program to the PLC.
Put the PLC in "RUN" mode and check the measurements:



You can also control the digital outputs by activating DOUT1 for example:



CMD and CMD AUX can be used to send commands to the device according to the following table:

COMMAND CODE(decimal)	***ACTION***
260	Reset MIN/MAX
259	Reset AVG
261	Reset Energy Counters
40986	Load value in CMD_AUX register to COUNTER1
41002	Load value in CMD_AUX register to COUNTER2

25.2. *UaEXPERT™ CLIENT CONFIGURATION*

To perform a test connection, use the UaExpert™ software.
UaExpert™ is a complete OPC UA client capable of supporting different OPC UA profiles and features.
The free version can be downloaded from the link:

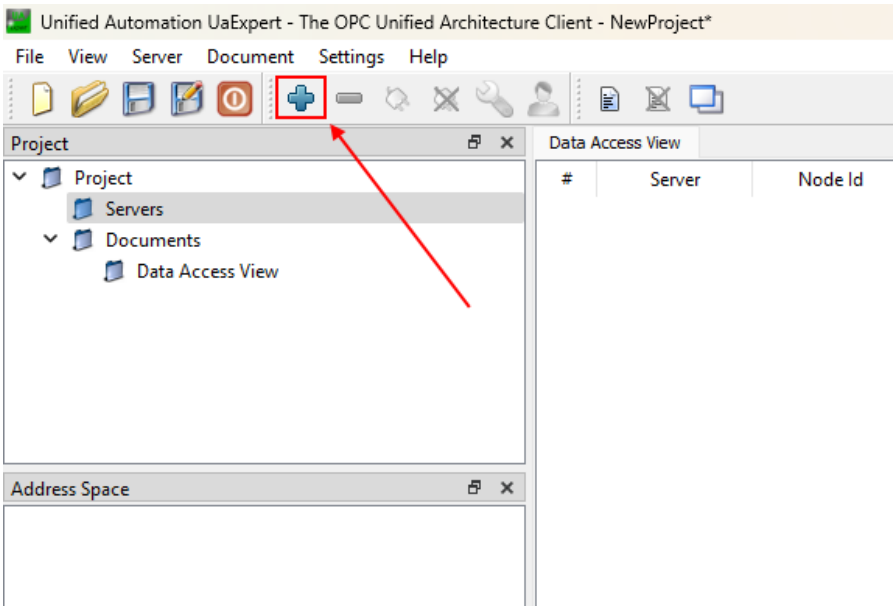
https://www.unified-automation.com/downloads.html

First, configure the OPC-UA server parameters in the webserver of the device (OPC-UA settings section):

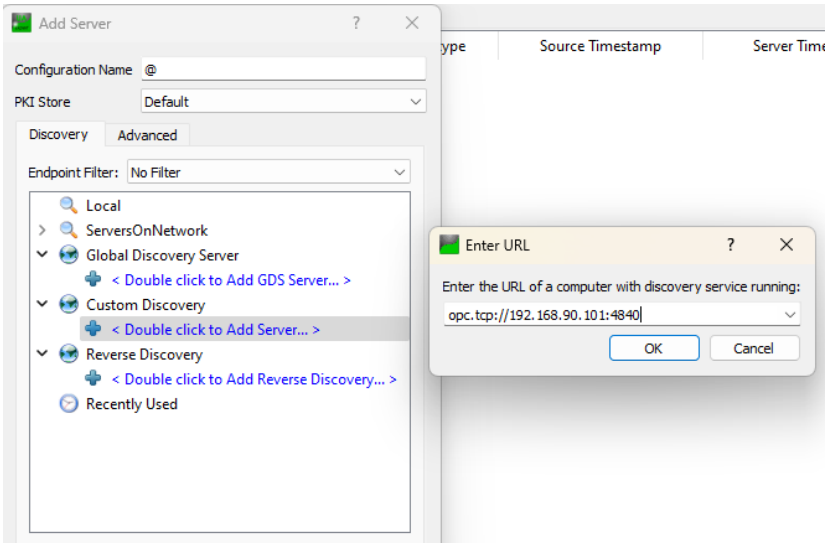
OPC-UA SETTING		
SERVER NAME	R203	R203
SERVER PORT	4840	4840
AUTHENTICATION	OFF	ON
USERNAME	admin	admin
PASSWORD	admin	admin
OPC-UA SERVER SECURITY POLICY	NONE	AES128SHA256RSAOAEP
OPC-UA SERVER MESSAGE SECURITY MODE	SIGN AND ENCRYPT	SIGN AND ENCRYPT

In this way you have activated the indicated security policy.
Use certificates by default.

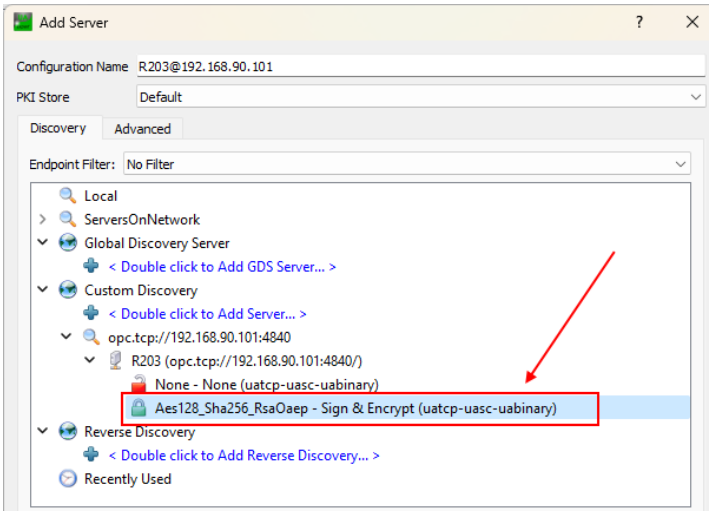
Now open the OPC-UA client and press the “+” icon to add an OPC-UA server:



At this point under "Custom directory" we enter the IP address of the device (192.168.90.101 in the example) and the configured port (4840 in the example):



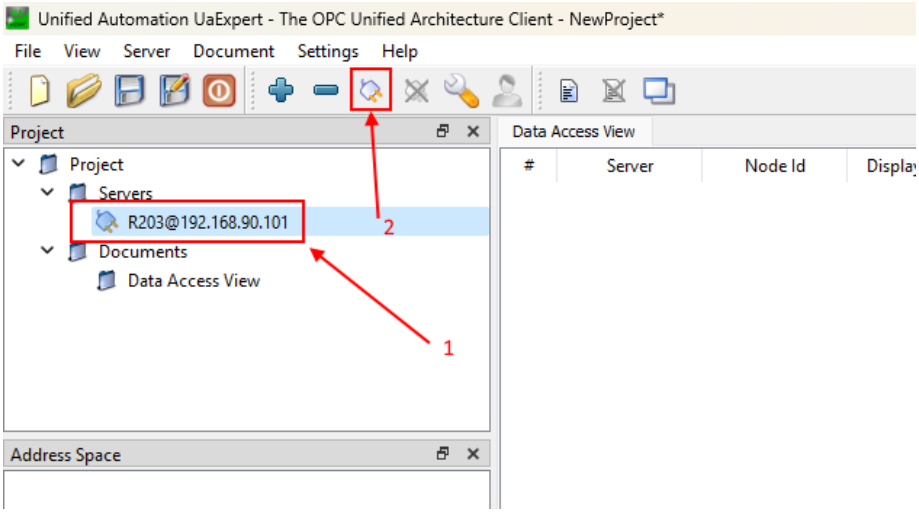
By pressing OK the server is added to the list, select the desired encryption:



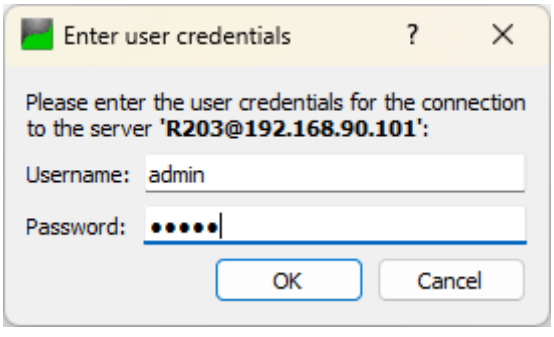
Press OK

Now the server is added.

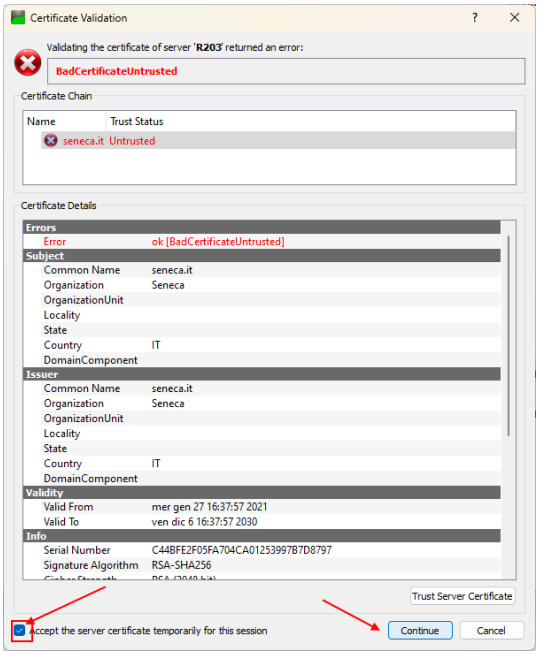
First select the server and then press the connection icon:



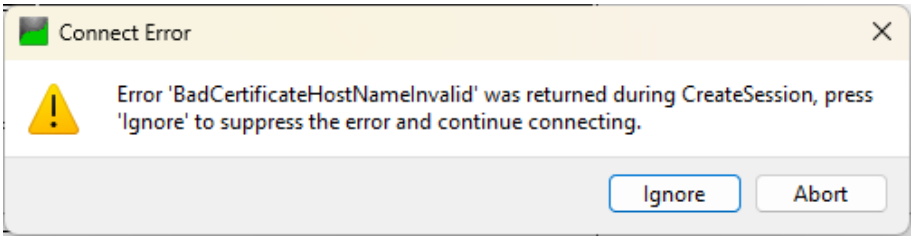
You will be asked for your credentials as configured:

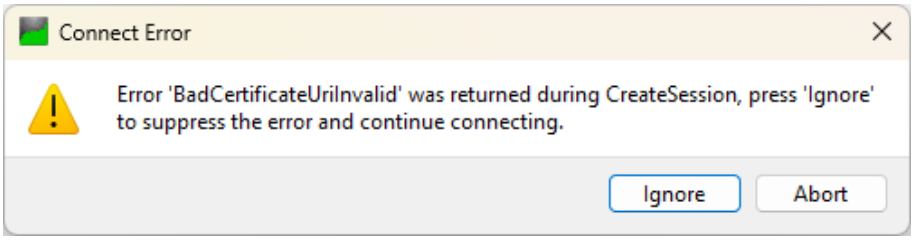


At this point a screen will appear indicating that the certificate is not secure:

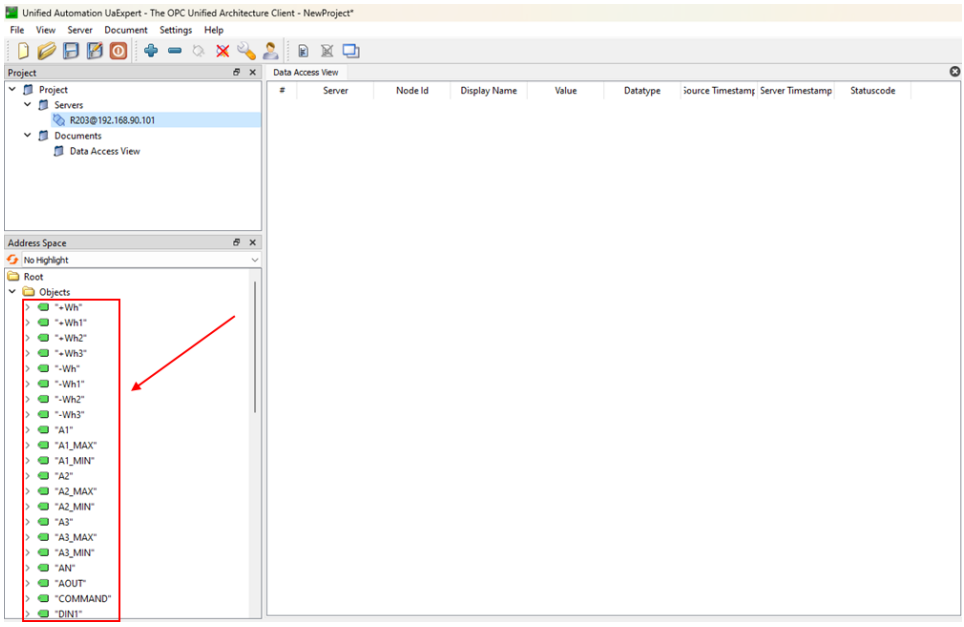


Accept the certificate and press the “Continue” button.
Now ignore the next two certificate-related errors:

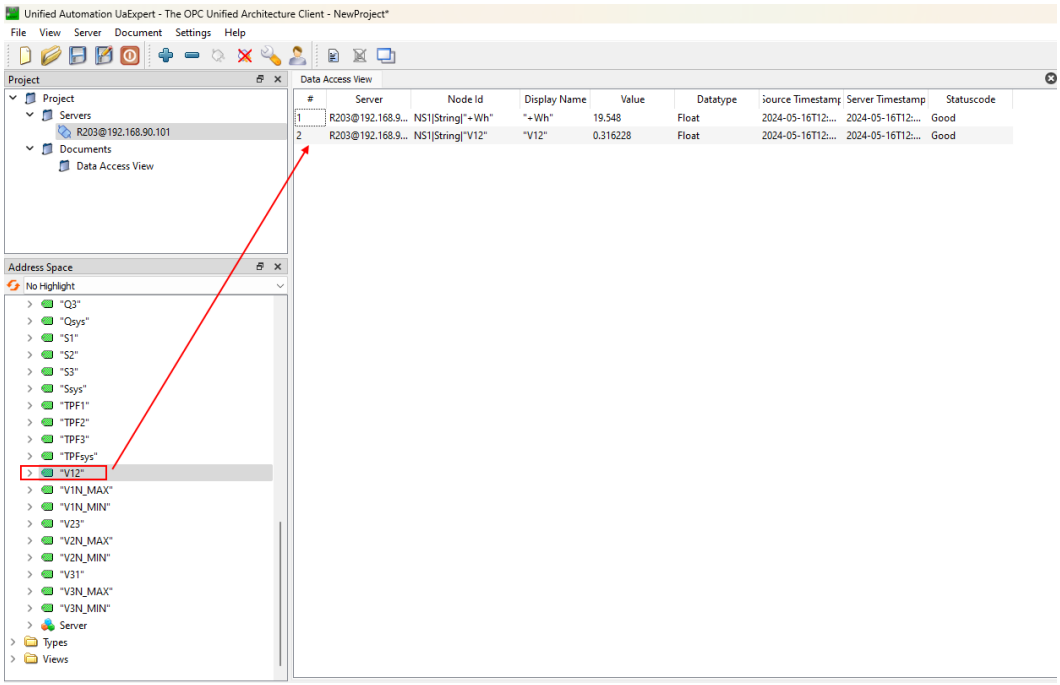




Now the connection is established and the configured list of variables appears:



Now you can drag the variables you want to view:



It is also possible to write on the variables in read/write mode, for example it is possible to activate the digital output DOUT2 by writing the value to 1:
